Key words and phrases. Free manifold, Free equation

ABSTRACT. This is an introduction to free manifolds, and to analysis on them. The space \mathbb{R}^N has no free analogue, but the unit sphere does have a free analogue, $S_{\mathbb{R},+}^{N-1}$. More generally, we can talk about submanifolds $X \subset S_{\mathbb{R},+}^{N-1}$, which under suitable assumptions have a Laplace operator Δ . We discuss here the basics of free manifolds, then the Laplace equation $\Delta f = 0$ in this setting, and then various free analogues of the main PDE of physics. The mathematics is quite interesting, suggesting the existence of a free electrodynamics theory, conjecturally related to questions in QCD.

Preface

As you surely know, the main question in theoretical physics is that of improving the Standard Model for elementary particles, which dates back to the 1970s. Although there have been many discoveries recently in quantum physics, sometimes accompanied by new engineering feats, the truth remains that our basic knowledge of quantum theory goes back to that old model. And as long as we remain unable to improve that model, our flagship quantum technologies, such as nuclear power, will basically remain stuck.

You probably know too that theoretical physicists are not alone in struggling with this question, because large branches of mathematics are trying to solve this problem too. Indeed, this is certainly true for many people doing PDE or probability, who often get involved, openly, into such questions. As for pure mathematics, that is not as pure as it might seem, because its main architects from the 70s and 80s, such as Atiyah, Connes, Jones and others, were having precisely these Standard Model questions in mind.

The aim of the present book is to present one of the many speculations that can be made, in connection with such questions. Importantly, while not yet really connected to physics, these speculations are quite fresh, going back to the 2010s and early 2020s, and so are a sort of a “start-up” operation, whose potential remains to be determined.

The starting point is the start of quantum mechanics, as we know it from Heisenberg and others. As you zoom down, to the level of protons, electrons and neutrons, things become noncommutative. And this leads to the natural idea that, maybe, if we zoom further down, things might perhaps drastically simplify, and become free.

At the first glance, this might sound like a worthless, wild speculation. However, there is in fact increasing evidence for this. To start with, linguistically at least, it is known since 1973 that quarks are subject to “asymptotic freedom”, and whether that famous freedom is the same as mathematical freeness, remains to be determined.

More concretely now, Connes and collaborators have done a lot of work on the Standard Model in their noncommutative geometry formulation, and one of the features of their formalism is that it allows the construction of a “free gauge group” of the Standard Model. Via some standard twisting results, acting on the QED part is S_4^+ , and acting on

the QCD part is S_9^+ . This is quite interesting, suggesting that QED and QCD, suitably twisted, might be some sort of Yang-Mills theories based on S_4^+, S_9^+ , respectively.

Another approach, with the theory here going back to work of Yang-Baxter, Faddeev and the Leningrad School, then Drinfeld-Jimbo, and especially Jones and others, is via statistical mechanics and lattice models. Again, this leads to quantum groups, which are traditionally deformed with the help of a parameter $q \in \mathbb{C}$, but which can be as well undeformed, and rather free, depending on which precise model you are looking at.

Yet another approach, and facet of the problem, which is the one that we will describe in this book, is via some sort of “reverse engineering”. Indeed, let us temporarily forget about physics. Mathematically then, a free sphere $S_{\mathbb{R},+}^{N-1}$ is not hard to construct, and afterwards you can simply go ahead with mathematics, developed without thinking much: free manifolds, free Laplace operator, free harmonic functions, free PDE. In short, free everything, and the question which appears at the end, coming from free PDE, is whether that new mathematics corresponds to some sort of “free physics”, and then, importantly, whether that free physics is true physics, at very small scales, or not.

This sounds quite reasonable, and we will have here a look, at all this. The conjecture at the end will be that there should be a kind of “free electrodynamics” theory, very related to QCD. However, a bit as before with the above-mentioned other approaches, this remains just a facet of the problem. Further advancing, and then putting all the pieces of the puzzle together, remains of course an open problem.

Many thanks go to my colleagues who contributed to the theory discussed here. Thanks as well to my sister Valeria, who’s a mathematician like me, but doing hard-line PDE, and I will certainly find a way to talk about her exciting work with Luis, in this book. Finally, many thanks to my PDE colleagues in Cergy, and cats at home, nothing better as work environment, than being surrounded by various apex predators.

Part I

Free space

*Plain talking
Take us so far
Broken down cars
Like strung out old stars*

CHAPTER 1

Free spheres

1a. Free tori

Welcome to freeness. We will be interested in this book in developing free geometry and analysis, with the hope that all this might be related to physics, at very small scales, quarks or below. Before anything, all this is well-known to be complicated business, and technically, it is an open problem. So, we will use a trick, developing first as much free geometry and analysis as we can, hard work done in the dark, a bit like miners working in a mine, and only afterwards, towards the end of the book, we will go to the surface, and look at all this under the light of true physics, see if we have some diamonds or not. With diamond meaning free PDE having an interesting physical meaning.

In short, expect a lot of mathematics, at least to start with, correct as mathematics usually comes, but not necessarily very logical, also as mathematics usually comes.

Helping with writing, however, will be my cat assistant, who knows some physics. Usually cats won't tell, at that level of wisdom you admire this world as it was created, with bigger animals eating smaller animals, evolution and so on. However, I have my own tricks, and although I'm very slow, and with a lame diet by his standards, cat ranks me somewhere higher than dogs and bears, and is sometimes willing to help.

And good news, cat is here, so let's ask him how to get started:

CAT 1.1. *Normally for high speed physics and freeness, you need to be fast and free yourself. But yes, do some math, and start with what you know.*

Thanks cat, I was kind of expecting this, but the advice at the end is really helpful. I was twisting my mind with looking for a free analogue of \mathbb{R}^N , for developing afterwards free geometry and analysis inside, sort of a nice program, as any mathematician would do. But, as cat says, let's better relax, and start with what we know.

So, what's free? The simplest free object in mathematics is the free group F_N :

DEFINITION 1.2. *The free group F_N is the infinite group*

$$F_N = \langle g_1, \dots, g_N \mid \emptyset \rangle$$

generated by N variables g_1, \dots, g_N , with no relations between them.

This might look a bit abstract, but no worries, F_N has some interesting mathematics, coming right away, if you have some knowledge in discrete groups, and know how to look for interesting questions. For instance if you want to draw the Cayley graph of F_N , whose vertices are the elements of F_N , with edges $h - k$ drawn when $h = g_i^{\pm 1}k$ for some i , you will end up with an interesting picture, which at $N = 2$ looks like this:

And this type of graph certainly has interesting mathematics. One good question for instance is that of computing the number of length $2k$ loops based at the root. Another question, which is in fact equivalent, via moments, is that of computing the Kesten measure of F_N , which is that of the following variable in the group algebra of F_N :

$$\chi = g_1 + \dots + g_N$$

All this looks very good, we most likely have here our first object of free geometry, the above graph, regarded as some sort of “manifold”, and mathematically speaking, this manifold is as good and interesting as manifolds can get. However, before going ahead with loops and Kesten, let’s ask the cat, who’s still around. Not that I need help with math, but sometimes a piece of recognition from a fellow physics colleague, for a bright idea like this, can bring pleasure. To my surprise, however, cat answers:

CAT 1.3. *You got it wrong with your math, that graph is not continuous, even by alien standards. It’s the dual of F_N which is a free manifold.*

Thanks cat, and interesting remark, indeed. In fact, I was too quick in developing free geometry, and forgot to think at classical geometry first. Here, if there is an interesting formula in relation with free groups and manifolds, this is the following formula, with $\mathbb{T}_N = \mathbb{T}^N$ being the usual torus, and with \mathbb{Z}^N being the free abelian group:

$$\mathbb{T}_N = \widehat{\mathbb{Z}^N}$$

Thus, getting back now to our free group F_N , which is the free analogue of \mathbb{Z}^N , it is its dual $\widehat{F_N}$ which is a free manifold, and more specifically the free analogue of \mathbb{T}^N . Which is a nice finding, so let us formulate our conclusions as follows:

DEFINITION 1.4. *The free torus \mathbb{T}_N^+ is the dual of the free group F_N ,*

$$\mathbb{T}_N^+ = \widehat{F}_N$$

in analogy with the fact that the usual torus $\mathbb{T}_N = \mathbb{T}^N$ appears as

$$\mathbb{T}_N = \widehat{\mathbb{Z}^N}$$

with on the right the group \mathbb{Z}^N being the free abelian group.

It is of course possible to formulate things more precisely, and we will be back to this in a moment, but before that, isn't this a bit too abstract? But the point here is that no, at the level of questions to be solved, these remain the same, as for instance the computation of the Kesten measure, which is now a “function” on the free torus:

$$\chi \in C(\mathbb{T}_N^+)$$

In fact, this function is the main character of \mathbb{T}_N^+ , regarded as a compact quantum group, and so our Kesten problem suddenly becomes something very conceptual, namely the computation of the law of the main character of \mathbb{T}_N^+ . Which is very nice.

Before getting into details regarding all this, recall that \mathbb{R}^N is as interesting as \mathbb{C}^N . So, let us formulate as well the real version of Definition 1.4, as follows:

DEFINITION 1.5. *The free real torus, or free cube, T_N^+ is the dual*

$$T_N^+ = \widehat{L}_N$$

of the group $L_N = F_N / \langle g_i^2 = 1 \rangle$, in analogy with the fact that the usual cube is

$$T_N = \widehat{\mathbb{Z}_2^N}$$

with on the right the group \mathbb{Z}_2^N being the free real abelian group.

Here the “real” at the end stands for the fact that the generators must satisfy the real reflection condition $g_i^2 = 1$. As for the fact that “real torus = cube”, as stated, this needs some thinking, and in the hope that, after such thinking, you will agree with me that there is indeed a standard torus inside \mathbb{R}^N , and that is the unit cube.

As before with the free complex torus \mathbb{T}_N^+ , there is some mathematics to be done with the free real torus T_N^+ , for instance in relation with the law of $\chi = g_1 + \dots + g_N$.

Summarizing, all this sounds good, we have a beginning of free geometry, both real and complex, worth developing, by knowing at least what the torus of each theory is. In practice now, at the level of details, in order to talk about $\mathbb{T}_N^+ = \widehat{F}_N$ and $T_N^+ = \widehat{L}_N$ we need an extension of the usual Pontrjagin duality theory for the abelian groups, and this is best done via operator algebras, and the related notion of compact quantum group.

1b. Quantum spaces

In view of the above, in order to fully understand what happens, let us start with operator algebras. You have probably already heard about infinite matrices, operators and operator algebras, from Heisenberg, Schrödinger, Dirac and others. As a starting point for this, we need a complex Hilbert space H , with the main example in mind being the space $H = L^2(\mathbb{R}^3)$ of the wave functions of the electron. So, let us formulate:

DEFINITION 1.6. *A Hilbert space is a complex vector space H , given with a scalar product $\langle x, y \rangle$, satisfying the following conditions:*

- (1) $\langle x, y \rangle$ is linear in x , and antilinear in y .
- (2) $\overline{\langle x, y \rangle} = \langle y, x \rangle$, for any x, y .
- (3) $\langle x, x \rangle \geq 0$, for any $x \neq 0$.
- (4) H is complete with respect to the norm $\|x\| = \sqrt{\langle x, x \rangle}$.

This looks nice and correct, with the remark that (4) assumes that you know about Cauchy-Schwarz, but thinking well, I'm using here mathematicians' convention for scalar products, linear at left, and aren't we supposed to do as Dirac and other physicists do, with the scalar products linear at right. And making a decision here does not seem to be an easy question, shall we trade the usefulness of Dirac's bras and kets $\langle x|$ and $|y \rangle$ for mathematical simplicity, I mean what's simple and linear must come first.

I'm afraid I will have to disturb again the cat. And cat says:

CAT 1.7. *Bras and kets are made to interact, and love each other, and that vertical bar is a bad idea, preventing the physics to happen.*

Interesting remark, so if I understand well $\langle x|y \rangle$ being a bad idea, and I fully agree with this because that vertical bar $|$ slows down computations anyway, we are left with $\langle x, y \rangle$, and free to choose the linearity as we like. So, Definition 1.6 is correct.

Moving ahead, we need to talk about operators. Again, you might have heard of these from Heisenberg, Schrödinger, Dirac and others, and with the theory being quite complicated to read and digest, because these operators, while fortunately self-adjoint, are unfortunately unbounded. However, cat who's still around, declares:

CAT 1.8. *Self-adjoint and unbounded operators are nice, but not fast enough. For fast physics, you need non-self-adjoint, bounded operators.*

Thanks cat, this sounds good, and again agrees with my mathematical intuition, the bounded operators are the simplest, and who cares about self-adjointness, and I would be even happier not to get into that, I prefer these bounded operators to be arbitrary.

So, bounded operators. These are in fact quite tricky to study, even when taken arbitrary, and after some work, we can formulate, as a first theorem for our book:

THEOREM 1.9. *The linear operators $T : H \rightarrow H$ which are bounded, meaning that*

$$\|T\| = \sup_{\|x\| \leq 1} \|Tx\|$$

is finite, form a complex algebra $B(H)$, having the following properties:

- (1) *$B(H)$ is complete with respect to $\|\cdot\|$, so we have a Banach algebra.*
- (2) *$B(H)$ has an involution $T \rightarrow T^*$, given by $\langle Tx, y \rangle = \langle x, T^*y \rangle$.*

In addition, the norm and involution are related by the formula $\|TT^\| = \|T\|^2$.*

PROOF. The fact that we have an algebra is clear, and the completeness comes from the fact that, assuming that $\{T_n\} \subset B(H)$ is Cauchy, then $\{T_n x\}$ is Cauchy for any $x \in H$, so we can define the limit $T = \lim_{n \rightarrow \infty} T_n$ by setting:

$$Tx = \lim_{n \rightarrow \infty} T_n x$$

Regarding $T \rightarrow T^*$, this comes from the fact that $\varphi(x) = \langle Tx, y \rangle$ being a linear form $\varphi : H \rightarrow \mathbb{C}$, we must have $\varphi(x) = \langle x, T^*y \rangle$, for a certain vector $T^*y \in H$. Thus we have a well-defined involution $T \rightarrow T^*$, which stays inside $B(H)$, because:

$$\begin{aligned} \|T\| &= \sup_{\|x\|=1} \sup_{\|y\|=1} \langle Tx, y \rangle \\ &= \sup_{\|y\|=1} \sup_{\|x\|=1} \langle x, T^*y \rangle \\ &= \|T^*\| \end{aligned}$$

Regarding now the last assertion, observe first that we have:

$$\|TT^*\| \leq \|T\| \cdot \|T^*\| = \|T\|^2$$

On the other hand, we have as well the following estimate:

$$\begin{aligned} \|T\|^2 &= \sup_{\|x\|=1} |\langle Tx, Tx \rangle| \\ &= \sup_{\|x\|=1} |\langle x, T^*Tx \rangle| \\ &\leq \|T^*T\| \end{aligned}$$

By replacing $T \rightarrow T^*$ we obtain from this $\|T\|^2 \leq \|TT^*\|$, so we are done. \square

Observe that when H comes with an orthonormal basis $\{e_i\}_{i \in I}$, the linear map $T \rightarrow M$ given by $M_{ij} = \langle Te_j, e_i \rangle$ produces an embedding as follows:

$$B(H) \subset M_I(\mathbb{C})$$

Moreover, in this picture the operation $T \rightarrow T^*$ takes a very simple form, namely:

$$(M^*)_{ij} = \overline{M_{ji}}$$

However, with examples like Schrödinger's wave function space $H = L^2(\mathbb{R}^3)$ in mind, it is better in general not to use bases, and accept Theorem 1.9 as stated.

Moving ahead, the conditions found in Theorem 1.9 suggest formulating:

DEFINITION 1.10. A C^* -algebra is a complex algebra A , having:

- (1) A norm $a \rightarrow \|a\|$, making it a Banach algebra.
- (2) An involution $a \rightarrow a^*$, satisfying $\|aa^*\| = \|a\|^2$.

As basic examples, we have $B(H)$ itself, as well as any norm closed $*$ -subalgebra $A \subset B(H)$. It is possible to prove that any C^* -algebra appears in this way, but we will not need in what follows this deep result, called GNS theorem after Gelfand, Naimark, Segal. So, let us simply agree that, by definition, the C^* -algebras A are some sort of “generalized operator algebras”, and their elements $a \in A$ can be thought of as being some kind of “generalized operators”, on some Hilbert space which is not present.

In practice, this vague idea is all that we need. Indeed, by taking some inspiration from linear algebra, we can emulate spectral theory in our setting, as follows:

PROPOSITION 1.11. Given $a \in A$, define its spectrum as being the set

$$\sigma(a) = \left\{ \lambda \in \mathbb{C} \mid a - \lambda \notin A^{-1} \right\}$$

and its spectral radius $\rho(a)$ as the radius of the smallest centered disk containing $\sigma(a)$.

- (1) The spectrum of a norm one element is in the unit disk.
- (2) The spectrum of a unitary element ($a^* = a^{-1}$) is on the unit circle.
- (3) The spectrum of a self-adjoint element ($a = a^*$) consists of real numbers.
- (4) The spectral radius of a normal element ($aa^* = a^*a$) is equal to its norm.

PROOF. The first claim is that for any polynomial $f \in \mathbb{C}[X]$, and more generally for any rational function $f \in \mathbb{C}(X)$ having poles outside $\sigma(a)$, we have:

$$\sigma(f(a)) = f(\sigma(a))$$

This indeed something well-known for the usual matrices, and in general, the proof is similar. Regarding now the assertions in the statement, these all follow from this:

- (1) This comes from the following formula, valid when $\|a\| < 1$:

$$\frac{1}{1-a} = 1 + a + a^2 + \dots$$

- (2) Assuming $a^* = a^{-1}$, if we denote by D the unit disk, we have, by using (1):

$$\|a\| = 1 \implies \sigma(a) \subset D$$

$$\|a^{-1}\| = 1 \implies \sigma(a^{-1}) \subset D$$

On the other hand, by using the rational function $f(z) = z^{-1}$, we have:

$$\sigma(a^{-1}) \subset D \implies \sigma(a) \subset D^{-1}$$

Now by putting everything together we obtain, as desired:

$$\sigma(a) \subset D \cap D^{-1} = \mathbb{T}$$

(3) This follows from (2), by using the rational function $f(z) = (z + it)/(z - it)$. Indeed, for $t \gg 0$ we have the following computation:

$$\left(\frac{a + it}{a - it}\right)^* = \frac{a - it}{a + it} = \left(\frac{a + it}{a - it}\right)^{-1}$$

Thus the element $f(a)$ is a unitary, and by using (2) its spectrum is contained in \mathbb{T} . We conclude from this that we have:

$$f(\sigma(a)) = \sigma(f(a)) \subset \mathbb{T}$$

But this shows that we have $\sigma(a) \subset f^{-1}(\mathbb{T}) = \mathbb{R}$, as desired.

(4) We already know that we have $\rho(a) \leq \|a\|$, for any $a \in A$. For the reverse inequality, when a is normal, we fix a number $\rho > \rho(a)$. We have then:

$$\begin{aligned} \int_{|z|=\rho} \frac{z^n}{z - a} dz &= \int_{|z|=\rho} \sum_{k=0}^{\infty} z^{n-k-1} a^k dz \\ &= \sum_{k=0}^{\infty} \left(\int_{|z|=\rho} z^{n-k-1} dz \right) a^k \\ &= a^{n-1} \end{aligned}$$

By applying the norm and taking n -th roots we obtain from this formula:

$$\rho \geq \lim_{n \rightarrow \infty} \|a^n\|^{1/n}$$

When $a = a^*$ we have $\|a^n\| = \|a\|^n$ for any exponent of type $n = 2^k$, by using the C^* -algebra condition $\|aa^*\| = \|a\|^2$, and by taking n -th roots we get, as desired:

$$\rho(a) \geq \|a\|$$

In the general normal case now, $aa^* = a^*a$, we have $a^n(a^n)^* = (aa^*)^n$, and by using this, along with the result for self-adjoints, applied to aa^* , we obtain:

$$\begin{aligned} \rho(a) &\geq \lim_{n \rightarrow \infty} \|a^n\|^{1/n} = \sqrt{\lim_{n \rightarrow \infty} \|a^n(a^n)^*\|^{1/n}} \\ &= \sqrt{\lim_{n \rightarrow \infty} \|(aa^*)^n\|^{1/n}} = \sqrt{\rho(aa^*)} \\ &= \sqrt{\|a\|^2} = \|a\| \end{aligned}$$

Thus, we are led to the conclusion in the statement. \square

Generally speaking, Proposition 1.11 is all that you need for doing further operator algebras, only military grade weapons there. As a main application, we have:

THEOREM 1.12 (Gelfand). *If X is a compact space, the algebra $C(X)$ of continuous functions $f : X \rightarrow \mathbb{C}$ is a commutative C^* -algebra, with structure as follows:*

- (1) *The norm is the usual sup norm, $\|f\| = \sup_{x \in X} |f(x)|$.*
- (2) *The involution is the usual involution, $f^*(x) = \overline{f(x)}$.*

Conversely, any commutative C^ -algebra is of the form $C(X)$, with its “spectrum” $X = \text{Spec}(A)$ appearing as the space of characters $\chi : A \rightarrow \mathbb{C}$.*

PROOF. Given a commutative C^* -algebra A , we can define indeed X to be the set of characters $\chi : A \rightarrow \mathbb{C}$, with the topology making continuous all the evaluation maps $ev_a : \chi \rightarrow \chi(a)$. Then X is a compact space, and $a \rightarrow ev_a$ is a morphism of algebras:

$$ev : A \rightarrow C(X)$$

We first prove that ev is involutive. We use the following formula:

$$a = \frac{a + a^*}{2} - i \cdot \frac{i(a - a^*)}{2}$$

Thus it is enough to prove the equality $ev_{a^*} = ev_a^*$ for self-adjoint elements a . But this is the same as proving that $a = a^*$ implies that ev_a is a real function, which is in turn true, because $ev_a(\chi) = \chi(a)$ is an element of $\sigma(a)$, contained in \mathbb{R} . So, claim proved. Also, since A is commutative, each element is normal, so ev is isometric:

$$\|ev_a\| = \rho(a) = \|a\|$$

It remains to prove that ev is surjective. But this follows from the Stone-Weierstrass theorem, because $ev(A)$ is a closed subalgebra of $C(X)$, which separates the points. \square

The Gelfand theorem suggests formulating the following definition:

DEFINITION 1.13. *Given a C^* -algebra A , not necessarily commutative, we write*

$$A = C(X)$$

and call the abstract object X a “compact quantum space”.

This might look quite revolutionary, but in practice, this definition changes nothing to what we have been doing so far, namely studying the C^* -algebras. So, we will keep studying the C^* -algebras, but by using the above fancy quantum space terminology. For instance whenever we have a morphism $\Phi : A \rightarrow B$, we will write $A = C(X)$, $B = C(Y)$, and rather speak of the corresponding morphism $\phi : Y \rightarrow X$. And so on.

Taking a break now from all this, mathematics endlessly building and self-replicating, once started, like some sort of monster, shall we perhaps think a bit at the physical meaning of all this. I am particularly concerned by the fact that our quantum spaces are compact, if there is one good space for math and physics, that is \mathbb{R}^N , which is obviously not compact, so shouldn't be our quantum spaces not compact either.

This does not look like an obvious question, so time to ask the cat. And cat says:

CAT 1.14. *The strong force is confined, expect mathematical freeness to be confined too. As strange as this might sound, linguistically speaking.*

Thanks cat, but this sounds a bit too deep, to the point that I cannot tell if it's a joke or not. In any case, I take it as an encouragement, so we'll go for confinement and compactness, as a continuation of the above, and may the strong force be with us.

So, getting back now to our operator algebra machinery, what's next? Actually, now that we have our definition for the quantum spaces, good time to get back towards Definitions 1.4 and 1.5. In order to understand what that free tori are, we will need:

THEOREM 1.15. *Let Γ be a discrete group, and consider the complex group algebra $\mathbb{C}[\Gamma]$, with involution given by the fact that all group elements are unitaries, $g^* = g^{-1}$.*

- (1) *The maximal C^* -seminorm on $\mathbb{C}[\Gamma]$ is a C^* -norm, and the closure of $\mathbb{C}[\Gamma]$ with respect to this norm is a C^* -algebra, denoted $C^*(\Gamma)$.*
- (2) *When Γ is abelian, we have an isomorphism $C^*(\Gamma) \simeq C(G)$, where $G = \widehat{\Gamma}$ is its Pontrjagin dual, formed by the characters $\chi : \Gamma \rightarrow \mathbb{T}$.*

PROOF. All this is very standard, the idea being as follows:

(1) In order to prove the result, we must find a $*$ -algebra embedding $\mathbb{C}[\Gamma] \subset B(H)$, with H being a Hilbert space. For this purpose, consider the space $H = l^2(\Gamma)$, having $\{h\}_{h \in \Gamma}$ as orthonormal basis. Our claim is that we have an embedding, as follows:

$$\pi : \mathbb{C}[\Gamma] \subset B(H) \quad , \quad \pi(g)(h) = gh$$

Indeed, since $\pi(g)$ maps the basis $\{h\}_{h \in \Gamma}$ into itself, this operator is well-defined, bounded, and is an isometry. It is also clear from the formula $\pi(g)(h) = gh$ that $g \rightarrow \pi(g)$ is a morphism of algebras, and since this morphism maps the unitaries $g \in \Gamma$ into isometries, this is a morphism of $*$ -algebras. Finally, the faithfulness of π is clear.

(2) Since Γ is abelian, the corresponding group algebra $A = C^*(\Gamma)$ is commutative. Thus, we can apply the Gelfand theorem, and we obtain $A = C(X)$, with:

$$X = \text{Spec}(A)$$

But the spectrum $X = \text{Spec}(A)$, consisting of the characters $\chi : C^*(\Gamma) \rightarrow \mathbb{C}$, can be identified with the Pontrjagin dual $G = \widehat{\Gamma}$, and this gives the result. \square

The above result suggests the following definition:

DEFINITION 1.16. *Given a discrete group Γ , the compact quantum space G given by*

$$C(G) = C^*(\Gamma)$$

is called abstract dual of Γ , and is denoted $G = \widehat{\Gamma}$.

Good news, this definition is exactly what we need, in order to understand the meaning of Definitions 1.4 and 1.5. To be more precise, we have the following result:

THEOREM 1.17. *The basic tori are all group duals, as follows,*

$$\begin{array}{ccc}
 T_N^+ & \longrightarrow & \mathbb{T}_N^+ \\
 \uparrow & & \uparrow \\
 T_N & \longrightarrow & \mathbb{T}_N
 \end{array}
 =
 \begin{array}{ccc}
 \widehat{L}_N & \longrightarrow & \widehat{F}_N \\
 \uparrow & & \uparrow \\
 \mathbb{Z}_2^N & \longrightarrow & \mathbb{T}^N
 \end{array}$$

where $F_N = \mathbb{Z}^{*N}$ is the free group on N generators, and $L_N = \mathbb{Z}_2^{*N}$ is its real version.

PROOF. The basic tori appear indeed as group duals, and together with the Fourier transform identifications from Theorem 1.15 (2), this gives the result. \square

Moving ahead, now that we have our formalism, we can start developing free geometry. As a first objective, we would like to better understand the relation between the classical and free tori. In order to discuss this, let us introduce the following notion:

DEFINITION 1.18. *Given a compact quantum space X , its classical version is the usual compact space $X_{class} \subset X$ obtained by dividing $C(X)$ by its commutator ideal:*

$$C(X_{class}) = C(X)/I \quad , \quad I = \langle [a, b] \rangle$$

In this situation, we also say that X appears as a “liberation” of X .

In other words, the space X_{class} appears as the Gelfand spectrum of the commutative C^* -algebra $C(X)/I$. Observe in particular that X_{class} is indeed a classical space.

In relation now with our tori, we have the following result:

THEOREM 1.19. *We have inclusions between the various tori, as follows,*

$$\begin{array}{ccc}
 T_N^+ & \longrightarrow & \mathbb{T}_N^+ \\
 \uparrow & & \uparrow \\
 T_N & \longrightarrow & \mathbb{T}_N
 \end{array}$$

and the free tori on top appear as liberations of the tori on the bottom.

PROOF. This is indeed clear from definitions, because commutativity of a group algebra means precisely that the group in question is abelian. \square

As a conclusion now to all this, we have a beginning of free geometry, both real and complex, by knowing at least what the torus of each theory is. And with our construction being definitely the good one, for the simple reason that the main problems in the analysis of the free groups correspond in this way the main questions in our free geometry.

1c. Free spheres

In order to extend now the free geometries that we have, real and complex, let us begin with the spheres. Following [11], we have the following notions:

DEFINITION 1.20. *We have free real and complex spheres, defined via*

$$C(S_{\mathbb{R},+}^{N-1}) = C^* \left(x_1, \dots, x_N \mid x_i = x_i^*, \sum_i x_i^2 = 1 \right)$$

$$C(S_{\mathbb{C},+}^{N-1}) = C^* \left(x_1, \dots, x_N \mid \sum_i x_i x_i^* = \sum_i x_i^* x_i = 1 \right)$$

where the symbol C^* stands for universal enveloping C^* -algebra.

Here the fact that these algebras are indeed well-defined comes from the following estimate, which shows that the biggest C^* -norms on these $*$ -algebras are bounded:

$$\|x_i\|^2 = \|x_i x_i^*\| \leq \left\| \sum_i x_i x_i^* \right\| = 1$$

As a first result now, regarding the above free spheres, we have:

THEOREM 1.21. *We have embeddings of compact quantum spaces, as follows,*

$$\begin{array}{ccc} S_{\mathbb{R},+}^{N-1} & \longrightarrow & S_{\mathbb{C},+}^{N-1} \\ \uparrow & & \uparrow \\ S_{\mathbb{R}}^{N-1} & \longrightarrow & S_{\mathbb{C}}^{N-1} \end{array}$$

and the spaces on top appear as liberations of the spaces on the bottom.

PROOF. The first assertion, regarding the inclusions, comes from the fact that at the level of the associated C^* -algebras, we have surjective maps, as follows:

$$\begin{array}{ccc} C(S_{\mathbb{R},+}^{N-1}) & \longleftarrow & C(S_{\mathbb{C},+}^{N-1}) \\ \downarrow & & \downarrow \\ C(S_{\mathbb{R}}^{N-1}) & \longleftarrow & C(S_{\mathbb{C}}^{N-1}) \end{array}$$

For the second assertion, we must establish the following isomorphisms, where the symbol C_{comm}^* stands for “universal commutative C^* -algebra generated by”:

$$C(S_{\mathbb{R}}^{N-1}) = C_{comm}^* \left(x_1, \dots, x_N \mid x_i = x_i^*, \sum_i x_i^2 = 1 \right)$$

$$C(S_{\mathbb{C}}^{N-1}) = C_{comm}^* \left(x_1, \dots, x_N \mid \sum_i x_i x_i^* = \sum_i x_i^* x_i = 1 \right)$$

It is enough to establish the second isomorphism. So, consider the second universal commutative C^* -algebra A constructed above. Since the standard coordinates on $S_{\mathbb{C}}^{N-1}$ satisfy the defining relations for A , we have a quotient map of as follows:

$$A \rightarrow C(S_{\mathbb{C}}^{N-1})$$

Conversely, let us write $A = C(S)$, by using the Gelfand theorem. The variables x_1, \dots, x_N become in this way true coordinates, providing us with an embedding $S \subset \mathbb{C}^N$. Also, the quadratic relations become $\sum_i |x_i|^2 = 1$, so we have $S \subset S_{\mathbb{C}}^{N-1}$. Thus, we have a quotient map $C(S_{\mathbb{C}}^{N-1}) \rightarrow A$, as desired, and this gives all the results. \square

1d. Algebraic manifolds

By using the free spheres constructed above, we can now formulate:

DEFINITION 1.22. *A real algebraic manifold $X \subset S_{\mathbb{C},+}^{N-1}$ is a closed quantum subspace defined, at the level of the corresponding C^* -algebra, by a formula of type*

$$C(X) = C(S_{\mathbb{C},+}^{N-1}) / \langle f_i(x_1, \dots, x_N) = 0 \rangle$$

for certain family of noncommutative polynomials, as follows:

$$f_i \in \mathbb{C} \langle x_1, \dots, x_N \rangle$$

We denote by $\mathcal{C}(X)$ the $*$ -subalgebra of $C(X)$ generated by the coordinates x_1, \dots, x_N .

As a basic example here, we have the free real sphere $S_{\mathbb{R},+}^{N-1}$. The classical spheres $S_{\mathbb{C}}^{N-1}$, $S_{\mathbb{R}}^{N-1}$, and their real submanifolds, are covered as well by this formalism. At the level of the general theory, we have the following version of the Gelfand theorem:

THEOREM 1.23. *If $X \subset S_{\mathbb{C},+}^{N-1}$ is an algebraic manifold, as above, we have*

$$X_{class} = \left\{ x \in S_{\mathbb{C}}^{N-1} \mid f_i(x_1, \dots, x_N) = 0 \right\}$$

and X appears as a liberation of X_{class} .

PROOF. This is something that we already met, in the context of the free spheres. In general, the proof is similar, by using the Gelfand theorem. Indeed, if we denote by X'_{class} the manifold constructed in the statement, then we have a quotient map of C^* -algebras as follows, mapping standard coordinates to standard coordinates:

$$C(X_{class}) \rightarrow C(X'_{class})$$

Conversely now, from $X \subset S_{\mathbb{C},+}^{N-1}$ we obtain $X_{class} \subset S_{\mathbb{C}}^{N-1}$. Now since the relations defining X'_{class} are satisfied by X_{class} , we obtain an inclusion $X_{class} \subset X'_{class}$. Thus, at the level of algebras of continuous functions, we have a quotient map of C^* -algebras as follows, mapping standard coordinates to standard coordinates:

$$C(X'_{class}) \rightarrow C(X_{class})$$

Thus, we have constructed a pair of inverse morphisms, and we are done. \square

Finally, once again at the level of the general theory, we have:

DEFINITION 1.24. *We agree to identify two real algebraic submanifolds $X, Y \subset S_{\mathbb{C},+}^{N-1}$ when we have a $*$ -algebra isomorphism between $*$ -algebras of coordinates*

$$f : \mathcal{C}(Y) \rightarrow \mathcal{C}(X)$$

mapping standard coordinates to standard coordinates.

We will see later the reasons for making this convention, coming from amenability. Now back to the tori, as constructed before, we can see that these are examples of algebraic manifolds, in the sense of Definition 1.22. In fact, we have the following result:

THEOREM 1.25. *The four main quantum spheres produce the main quantum tori*

$$\begin{array}{ccc} S_{\mathbb{R},+}^{N-1} & \longrightarrow & S_{\mathbb{C},+}^{N-1} \\ \uparrow & & \uparrow \\ S_{\mathbb{R}}^{N-1} & \longrightarrow & S_{\mathbb{C}}^{N-1} \end{array} \quad \longrightarrow \quad \begin{array}{ccc} T_N^+ & \longrightarrow & \mathbb{T}_N^+ \\ \uparrow & & \uparrow \\ T_N & \longrightarrow & \mathbb{T}_N \end{array}$$

via the formula $T = S \cap \mathbb{T}_N^+$, with the intersection being taken inside $S_{\mathbb{C},+}^{N-1}$.

PROOF. This comes from the above results, the situation being as follows:

(1) Free complex case. Here the formula in the statement reads $\mathbb{T}_N^+ = S_{\mathbb{C},+}^{N-1} \cap \mathbb{T}_N^+$. But this is something trivial, because we have $\mathbb{T}_N^+ \subset S_{\mathbb{C},+}^{N-1}$.

(2) Free real case. Here the formula in the statement reads $T_N^+ = S_{\mathbb{R},+}^{N-1} \cap \mathbb{T}_N^+$. But this is clear as well, the real version of \mathbb{T}_N^+ being T_N^+ .

(3) Classical complex case. Here the formula in the statement reads $\mathbb{T}_N = S_{\mathbb{C}}^{N-1} \cap \mathbb{T}_N^+$. But this is clear as well, the classical version of \mathbb{T}_N^+ being \mathbb{T}_N .

(4) Classical real case. Here the formula in the statement reads $T_N = S_{\mathbb{R}}^{N-1} \cap \mathbb{T}_N^+$. But this follows by intersecting the formulae from the proof of (2) and (3). \square

CHAPTER 2

Free rotations

2a. Quantum groups

In order to better understand the structure of $S_{\mathbb{R},+}^{N-1}, S_{\mathbb{C},+}^{N-1}$, we need to talk about free rotations. Following Woronowicz [99], let us start with:

DEFINITION 2.1. *A Woronowicz algebra is a C^* -algebra A , given with a unitary matrix $u \in M_N(A)$ whose coefficients generate A , such that the formulae*

$$\Delta(u_{ij}) = \sum_k u_{ik} \otimes u_{kj} \quad , \quad \varepsilon(u_{ij}) = \delta_{ij} \quad , \quad S(u_{ij}) = u_{ji}^*$$

define morphisms of C^ -algebras $\Delta : A \rightarrow A \otimes A$, $\varepsilon : A \rightarrow \mathbb{C}$, $S : A \rightarrow A^{opp}$.*

The morphisms Δ, ε, S are called comultiplication, counit and antipode. We say that A is cocommutative when $\Sigma\Delta = \Delta$, where $\Sigma(a \otimes b) = b \otimes a$ is the flip. We have the following result, which justifies the terminology and axioms:

PROPOSITION 2.2. *The following are Woronowicz algebras:*

(1) $C(G)$, with $G \subset U_N$ compact Lie group. Here the structural maps are:

$$\Delta(\varphi) = (g, h) \rightarrow \varphi(gh) \quad , \quad \varepsilon(\varphi) = \varphi(1) \quad , \quad S(\varphi) = g \rightarrow \varphi(g^{-1})$$

(2) $C^*(\Gamma)$, with $F_N \rightarrow \Gamma$ finitely generated group. Here the structural maps are:

$$\Delta(g) = g \otimes g \quad , \quad \varepsilon(g) = 1 \quad , \quad S(g) = g^{-1}$$

Moreover, we obtain in this way all the commutative/cocommutative algebras.

PROOF. This is something very standard, the idea being as follows:

(1) Given $G \subset U_N$, we can set $A = C(G)$, which is a Woronowicz algebra, together with the matrix $u = (u_{ij})$ formed by coordinates of G , given by:

$$g = \begin{pmatrix} u_{11}(g) & \dots & u_{1N}(g) \\ \vdots & & \vdots \\ u_{N1}(g) & \dots & u_{NN}(g) \end{pmatrix}$$

Conversely, if (A, u) is a commutative Woronowicz algebra, by using the Gelfand theorem we can write $A = C(X)$, with X being a certain compact space. The coordinates u_{ij} give then an embedding $X \subset M_N(\mathbb{C})$, and since the matrix $u = (u_{ij})$ is unitary we

actually obtain an embedding $X \subset U_N$, and finally by using the maps Δ, ε, S we conclude that our compact subspace $X \subset U_N$ is in fact a compact Lie group, as desired.

(2) Consider a finitely generated group $F_N \rightarrow \Gamma$. We can set $A = C^*(\Gamma)$, which is by definition the completion of the complex group algebra $\mathbb{C}[\Gamma]$, with involution given by $g^* = g^{-1}$, for any $g \in \Gamma$, with respect to the biggest C^* -norm, and we obtain a Woronowicz algebra, together with the diagonal matrix formed by the generators of Γ :

$$u = \begin{pmatrix} g_1 & & 0 \\ & \ddots & \\ 0 & & g_N \end{pmatrix}$$

Conversely, if (A, u) is a cocommutative Woronowicz algebra, the Peter-Weyl theory of Woronowicz, to be explained below, shows that the irreducible corepresentations of A are all 1-dimensional, and form a group Γ , and so we have $A = C^*(\Gamma)$, as desired. \square

In general now, the structural maps Δ, ε, S have the following properties:

PROPOSITION 2.3. *Let (A, u) be a Woronowicz algebra.*

(1) Δ, ε satisfy the usual axioms for a comultiplication and a counit, namely:

$$\begin{aligned} (\Delta \otimes id)\Delta &= (id \otimes \Delta)\Delta \\ (\varepsilon \otimes id)\Delta &= (id \otimes \varepsilon)\Delta = id \end{aligned}$$

(2) S satisfies the antipode axiom, on the $*$ -subalgebra generated by entries of u :

$$m(S \otimes id)\Delta = m(id \otimes S)\Delta = \varepsilon(\cdot)1$$

(3) In addition, the square of the antipode is the identity, $S^2 = id$.

PROOF. The two comultiplication axioms follow from:

$$\begin{aligned} (\Delta \otimes id)\Delta(u_{ij}) &= (id \otimes \Delta)\Delta(u_{ij}) = \sum_{kl} u_{ik} \otimes u_{kl} \otimes u_{lj} \\ (\varepsilon \otimes id)\Delta(u_{ij}) &= (id \otimes \varepsilon)\Delta(u_{ij}) = u_{ij} \end{aligned}$$

As for the antipode formulae, the verification here is similar. \square

Summarizing, the Woronowicz algebras appear to have nice properties. In view of Proposition 2.2 and Proposition 2.3, we can formulate the following definition:

DEFINITION 2.4. *Given a Woronowicz algebra A , we formally write*

$$A = C(G) = C^*(\Gamma)$$

and call G compact quantum group, and Γ discrete quantum group.

In relation with this, there are actually some analytic subtleties, coming from amenability, so our objects must be divided by a certain equivalence relation, for everything to work fine. To be more precise, we agree to write $(A, u) = (B, v)$ when there is a $*$ -algebra isomorphism as follows, mapping standard coordinates to standard coordinates:

$$\langle u_{ij} \rangle \simeq \langle v_{ij} \rangle \quad , \quad u_{ij} \rightarrow v_{ij}$$

Moving ahead now, let us call now corepresentation of A any unitary matrix $v \in M_n(A)$ satisfying the same conditions as those satisfied by u , namely:

$$\Delta(v_{ij}) = \sum_k v_{ik} \otimes v_{kj} \quad , \quad \varepsilon(v_{ij}) = \delta_{ij} \quad , \quad S(v_{ij}) = v_{ji}^*$$

These corepresentations can be thought of as corresponding representations of the underlying compact quantum group G . Following Woronowicz [99], we have:

THEOREM 2.5. *Any Woronowicz algebra has a unique Haar integration functional,*

$$\left(\int_G \otimes id \right) \Delta = \left(id \otimes \int_G \right) \Delta = \int_G (\cdot) 1$$

which can be constructed by starting with any faithful positive form $\varphi \in A^*$, and setting

$$\int_G = \lim_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n \varphi^{*k}$$

where $\phi * \psi = (\phi \otimes \psi) \Delta$. Moreover, for any corepresentation $v \in M_n(\mathbb{C}) \otimes A$ we have

$$\left(id \otimes \int_G \right) v = P$$

where P is the orthogonal projection onto $Fix(v) = \{\xi \in \mathbb{C}^n | v\xi = \xi\}$.

PROOF. Following [99], this can be done in 3 steps, as follows:

(1) Given $\varphi \in A^*$, our claim is that the following limit converges, for any $a \in A$:

$$\int_\varphi a = \lim_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n \varphi^{*k}(a)$$

Indeed, by linearity we can assume that a is the coefficient of corepresentation, $a = (\tau \otimes id)v$. But in this case, an elementary computation shows that we have the following formula, where P_φ is the orthogonal projection onto the 1-eigenspace of $(id \otimes \varphi)v$:

$$\left(id \otimes \int_\varphi \right) v = P_\varphi$$

(2) Since $v\xi = \xi$ implies $[(id \otimes \varphi)v]\xi = \xi$, we have $P_\varphi \geq P$, where P is the orthogonal projection onto the space $Fix(v) = \{\xi \in \mathbb{C}^n | v\xi = \xi\}$. The point now is that when $\varphi \in A^*$

is faithful, by using a positivity trick, one can prove that we have $P_\varphi = P$. Thus our linear form \int_φ is independent of φ , and is given on coefficients $a = (\tau \otimes id)v$ by:

$$\left(id \otimes \int_\varphi \right) v = P$$

(3) With the above formula in hand, the left and right invariance of $\int_G = \int_\varphi$ is clear on coefficients, and so in general, and this gives all the assertions. See [99]. \square

Consider the dense $*$ -subalgebra $\mathcal{A} \subset A$ generated by the coefficients of the fundamental corepresentation u , and endow it with the following scalar product:

$$\langle a, b \rangle = \int_G ab^*$$

We have then the following result, also due to Woronowicz [99]:

THEOREM 2.6. *We have the following Peter-Weyl type results:*

- (1) *Any corepresentation decomposes as a sum of irreducible corepresentations.*
- (2) *Each irreducible corepresentation appears inside a certain $u^{\otimes k}$.*
- (3) *$\mathcal{A} = \bigoplus_{v \in Irr(A)} M_{\dim(v)}(\mathbb{C})$, the summands being pairwise orthogonal.*
- (4) *The characters of irreducible corepresentations form an orthonormal system.*

PROOF. All these results are from [99], the idea being as follows:

(1) Given $v \in M_n(A)$, its intertwiner algebra $End(v) = \{T \in M_n(\mathbb{C}) | Tv = vT\}$ is a finite dimensional C^* -algebra, and so decomposes as $End(v) = M_{n_1}(\mathbb{C}) \oplus \dots \oplus M_{n_r}(\mathbb{C})$. But this gives a decomposition of type $v = v_1 + \dots + v_r$, as desired.

(2) Consider indeed the Peter-Weyl corepresentations, $u^{\otimes k}$ with k colored integer, defined by $u^{\otimes 0} = 1$, $u^{\otimes \circ} = u$, $u^{\otimes \bullet} = \bar{u}$ and multiplicativity. The coefficients of these corepresentations span the dense algebra \mathcal{A} , and by using (1), this gives the result.

(3) Here the direct sum decomposition, which is technically a $*$ -coalgebra isomorphism, follows from (2). As for the second assertion, this follows from the fact that $(id \otimes \int_G)v$ is the orthogonal projection P_v onto the space $Fix(v)$, for any corepresentation v .

(4) Let us define indeed the character of $v \in M_n(A)$ to be the matrix trace, $\chi_v = Tr(v)$. Since this character is a coefficient of v , the orthogonality assertion follows from (3). As for the norm 1 claim, this follows once again from $(id \otimes \int_G)v = P_v$. \square

2b. Free rotations

We can now talk about free rotations. Following Wang [89], we have:

THEOREM 2.7. *The following universal algebras are Woronowicz algebras,*

$$C(O_N^+) = C^* \left((u_{ij})_{i,j=1,\dots,N} \mid u = \bar{u}, u^t = u^{-1} \right)$$

$$C(U_N^+) = C^* \left((u_{ij})_{i,j=1,\dots,N} \mid u^* = u^{-1}, u^t = \bar{u}^{-1} \right)$$

so the underlying spaces O_N^+, U_N^+ are compact quantum groups.

PROOF. This follows from the elementary fact that if a matrix $u = (u_{ij})$ is orthogonal or biunitary, then so must be the following matrices:

$$u_{ij}^\Delta = \sum_k u_{ik} \otimes u_{kj} \quad , \quad u_{ij}^\varepsilon = \delta_{ij} \quad , \quad u_{ij}^S = u_{ji}^*$$

Thus, we can indeed define morphisms Δ, ε, S as in Definition 2.1, by using the universal properties of $C(O_N^+)$, $C(U_N^+)$, and this gives the result. \square

As a first question, we would like to know if our quantum groups O_N^+, U_N^+ are indeed bigger than O_N, U_N . But this question can be solved, in the affirmative, with the simplest way in order to see this being by looking at the corresponding diagonal tori.

Many other things can be said about O_N^+, U_N^+ , quite often in analogy with what we know about O_N, U_N , as a continuation of the above. We will be back to this.

2c. Quantum isometries

In order to discuss now the relation with the spheres, we will need:

PROPOSITION 2.8. *Given an algebraic manifold $X \subset S_{\mathbb{C},+}^{N-1}$, the category of the closed subgroups $G \subset U_N^+$ acting affinely on X , in the sense that the formula*

$$\Phi(x_i) = \sum_j x_j \otimes u_{ji}$$

defines a morphism of C^* -algebras $\Phi : C(X) \rightarrow C(X) \otimes C(G)$, has a universal object, denoted $G^+(X)$, and called affine quantum isometry group of X .

PROOF. Assume indeed that our manifold $X \subset S_{\mathbb{C},+}^{N-1}$ comes as follows:

$$C(X) = C(S_{\mathbb{C},+}^{N-1}) / \left\langle f_\alpha(x_1, \dots, x_N) = 0 \right\rangle$$

In order to prove the result, consider the following variables:

$$X_i = \sum_j x_j \otimes u_{ji} \in C(X) \otimes C(U_N^+)$$

Our claim is that the quantum group in the statement $G = G^+(X)$ appears as:

$$C(G) = C(U_N^+) / \left\langle f_\alpha(X_1, \dots, X_N) = 0 \right\rangle$$

In order to prove this, pick one of the defining polynomials, and write it as follows:

$$f_\alpha(x_1, \dots, x_N) = \sum_r \sum_{i_1^r \dots i_{s_r}^r} \lambda_r \cdot x_{i_1^r} \dots x_{i_{s_r}^r}$$

With $X_i = \sum_j x_j \otimes u_{ji}$ as above, we have the following formula:

$$f_\alpha(X_1, \dots, X_N) = \sum_r \sum_{i_1^r \dots i_{s_r}^r} \lambda_r \sum_{j_1^r \dots j_{s_r}^r} x_{j_1^r} \dots x_{j_{s_r}^r} \otimes u_{j_1^r i_1^r} \dots u_{j_{s_r}^r i_{s_r}^r}$$

Since the variables on the right span a certain finite dimensional space, the relations $f_\alpha(X_1, \dots, X_N) = 0$ correspond to certain relations between the variables u_{ij} . Thus, we have indeed a closed subspace $G \subset U_N^+$, with a universal map, as follows:

$$\Phi : C(X) \rightarrow C(X) \otimes C(G)$$

In order to show now that G is a quantum group, consider the following elements:

$$u_{ij}^\Delta = \sum_k u_{ik} \otimes u_{kj} \quad , \quad u_{ij}^\varepsilon = \delta_{ij} \quad , \quad u_{ij}^S = u_{ji}^*$$

Consider as well the following elements, with $\gamma \in \{\Delta, \varepsilon, S\}$:

$$X_i^\gamma = \sum_j x_j \otimes u_{ji}^\gamma$$

From the relations $f_\alpha(X_1, \dots, X_N) = 0$ we deduce that we have:

$$f_\alpha(X_1^\gamma, \dots, X_N^\gamma) = (id \otimes \gamma) f_\alpha(X_1, \dots, X_N) = 0$$

Thus we can map $u_{ij} \rightarrow u_{ij}^\gamma$ for any $\gamma \in \{\Delta, \varepsilon, S\}$, and we are done. \square

We can now formulate a result about spheres and rotations, as follows:

THEOREM 2.9. *The quantum isometry groups of the basic spheres are*

$$\begin{array}{ccc} S_{\mathbb{R},+}^{N-1} & \longrightarrow & S_{\mathbb{C},+}^{N-1} \\ \uparrow & & \uparrow \\ S_{\mathbb{R}}^{N-1} & \longrightarrow & S_{\mathbb{C}}^{N-1} \end{array} \quad \rightarrow \quad \begin{array}{ccc} O_N^+ & \longrightarrow & U_N^+ \\ \uparrow & & \uparrow \\ O_N & \longrightarrow & U_N \end{array}$$

modulo identifying, as usual, the various C^ -algebraic completions.*

PROOF. We have 4 results to be proved, the idea being as follows:

$S_{\mathbb{C},+}^{N-1}$. Let us first construct an action $U_N^+ \curvearrowright S_{\mathbb{C},+}^{N-1}$. We must prove here that the variables $X_i = \sum_j x_j \otimes u_{ji}$ satisfy the defining relations for $S_{\mathbb{C},+}^{N-1}$, namely:

$$\sum_i x_i x_i^* = \sum_i x_i^* x_i = 1$$

By using the biunitarity of u , we have the following computation:

$$\sum_i X_i X_i^* = \sum_{ijk} x_j x_k^* \otimes u_{ji} u_{ki}^* = \sum_j x_j x_j^* \otimes 1 = 1 \otimes 1$$

Once again by using the biunitarity of u , we have as well:

$$\sum_i X_i^* X_i = \sum_{ijk} x_j^* x_k \otimes u_{ji}^* u_{ki} = \sum_j x_j^* x_j \otimes 1 = 1 \otimes 1$$

Thus we have an action $U_N^+ \curvearrowright S_{\mathbb{C},+}^{N-1}$, which gives $G^+(S_{\mathbb{C},+}^{N-1}) = U_N^+$, as desired.

$S_{\mathbb{R},+}^{N-1}$. Let us first construct an action $O_N^+ \curvearrowright S_{\mathbb{R},+}^{N-1}$. We already know that the variables $X_i = \sum_j x_j \otimes u_{ji}$ satisfy the defining relations for $S_{\mathbb{C},+}^{N-1}$, so we just have to check that these variables are self-adjoint. But this is clear from $u = \bar{u}$, as follows:

$$X_i^* = \sum_j x_j^* \otimes u_{ji}^* = \sum_j x_j \otimes u_{ji} = X_i$$

Conversely, assume that we have an action $G \curvearrowright S_{\mathbb{R},+}^{N-1}$, with $G \subset U_N^+$. The variables $X_i = \sum_j x_j \otimes u_{ji}$ must be then self-adjoint, and the above computation shows that we must have $u = \bar{u}$. Thus our quantum group must satisfy $G \subset O_N^+$, as desired.

$S_{\mathbb{C}}^{N-1}$. The fact that we have an action $U_N \curvearrowright S_{\mathbb{C}}^{N-1}$ is clear. Conversely, assume that we have an action $G \curvearrowright S_{\mathbb{C}}^{N-1}$, with $G \subset U_N^+$. We must prove that this implies $G \subset U_N$, and we will use a standard trick of Bhowmick-Goswami [11]. We have:

$$\Phi(x_i) = \sum_j x_j \otimes u_{ji}$$

By multiplying this formula with itself we obtain:

$$\Phi(x_i x_k) = \sum_{jl} x_j x_l \otimes u_{ji} u_{lk}$$

$$\Phi(x_k x_i) = \sum_{jl} x_l x_j \otimes u_{lk} u_{ji}$$

Since the variables x_i commute, these formulae can be written as:

$$\Phi(x_i x_k) = \sum_{j<l} x_j x_l \otimes (u_{ji} u_{lk} + u_{li} u_{jk}) + \sum_j x_j^2 \otimes u_{ji} u_{jk}$$

$$\Phi(x_i x_k) = \sum_{j<l} x_j x_l \otimes (u_{lk} u_{ji} + u_{jk} u_{li}) + \sum_j x_j^2 \otimes u_{jk} u_{ji}$$

Since the tensors at left are linearly independent, we must have:

$$u_{ji} u_{lk} + u_{li} u_{jk} = u_{lk} u_{ji} + u_{jk} u_{li}$$

By applying the antipode to this formula, then applying the involution, and then relabelling the indices, we successively obtain:

$$\begin{aligned} u_{kl}^* u_{ij}^* + u_{kj}^* u_{il}^* &= u_{ij}^* u_{kl}^* + u_{il}^* u_{kj}^* \\ u_{ij} u_{kl} + u_{il} u_{kj} &= u_{kl} u_{ij} + u_{kj} u_{il} \\ u_{ji} u_{lk} + u_{jk} u_{li} &= u_{lk} u_{ji} + u_{li} u_{jk} \end{aligned}$$

Now by comparing with the original formula, we obtain from this:

$$u_{li} u_{jk} = u_{jk} u_{li}$$

In order to finish, it remains to prove that the coordinates u_{ij} commute as well with their adjoints. For this purpose, we use a similar method. We have:

$$\begin{aligned} \Phi(x_i x_k^*) &= \sum_{jl} x_j x_l^* \otimes u_{ji} u_{lk}^* \\ \Phi(x_k^* x_i) &= \sum_{jl} x_l^* x_j \otimes u_{lk}^* u_{ji} \end{aligned}$$

Since the variables on the left are equal, we deduce from this that we have:

$$\sum_{jl} x_j x_l^* \otimes u_{ji} u_{lk}^* = \sum_{jl} x_j x_l^* \otimes u_{lk}^* u_{ji}$$

Thus we have $u_{ji} u_{lk}^* = u_{lk}^* u_{ji}$, and so $G \subset U_N$, as claimed.

$S_{\mathbb{R}}^{N-1}$. The fact that we have an action $O_N \curvearrowright S_{\mathbb{R}}^{N-1}$ is clear. In what regards the converse, this follows by combining the results that we already have, as follows:

$$\begin{aligned} G \curvearrowright S_{\mathbb{R}}^{N-1} &\implies G \curvearrowright S_{\mathbb{R},+}^{N-1}, S_{\mathbb{C}}^{N-1} \\ &\implies G \subset O_N^+, U_N \\ &\implies G \subset O_N^+ \cap U_N = O_N \end{aligned}$$

Thus, we conclude that we have $G^+(S_{\mathbb{R}}^{N-1}) = O_N$, as desired. \square

2d. Haar integration

Let us discuss now the correspondence $U \rightarrow S$. In the classical case the situation is very simple, because the sphere $S = S^{N-1}$ appears by rotating the point $x = (1, 0, \dots, 0)$ by the isometries in $U = U_N$. Moreover, the stabilizer of this action is the subgroup $U_{N-1} \subset U_N$ acting on the last $N-1$ coordinates, and so the sphere $S = S^{N-1}$ appears from the corresponding rotation group $U = U_N$ as an homogeneous space, as follows:

$$S^{N-1} = U_N / U_{N-1}$$

In functional analytic terms, all this becomes even simpler, the correspondence $U \rightarrow S$ being obtained, at the level of algebras of functions, as follows:

$$C(S^{N-1}) \subset C(U_N) \quad , \quad x_i \rightarrow u_{1i}$$

In general now, the straightforward homogeneous space interpretation of S as above fails. However, we can have some theory going by using the functional analytic viewpoint, with an embedding $x_i \rightarrow u_{1i}$ as above. Let us start with the following result:

THEOREM 2.10. *For the basic spheres, we have a diagram as follows,*

$$\begin{array}{ccc} C(S) & \xrightarrow{\Phi} & C(S) \otimes C(U) \\ \downarrow \alpha & & \downarrow \alpha \otimes id \\ C(U) & \xrightarrow{\Delta} & C(U) \otimes C(U) \end{array}$$

where on top $\Phi(x_i) = \sum_j x_j \otimes u_{ji}$, and on the left $\alpha(x_i) = u_{1i}$.

PROOF. The diagram in the statement commutes indeed on the standard coordinates, the corresponding arrows being as follows, on these coordinates:

$$\begin{array}{ccc} x_i & \xrightarrow{\quad} & \sum_j x_j \otimes u_{ji} \\ \downarrow & & \downarrow \\ u_{1i} & \xrightarrow{\quad} & \sum_j u_{1j} \otimes u_{ji} \end{array}$$

Thus by linearity and multiplicativity, the whole the diagram commutes. \square

The point now is that, by further building on the above result, we obtain the desired correspondence $U \rightarrow S$, and some useful integration results as well.

At the level of the fine structure of the free spheres $S_{\mathbb{R},+}^{N-1}, S_{\mathbb{C},+}^{N-1}$ now, we have some obvious formal eigenspaces for the Laplace operator, and a Weingarten integration formula as well, both coming from the representation theory of O_N^+, U_N^+ . Moreover, it is possible to get beyond this, with a full construction of a Laplace operator.

Regarding other possible invariants, orientability does not work, the Dirac operator does not exist, smoothness does not work either, and in what regards K-theory, with our free objects we are a bit too far away from the traditional “reasonable” range of K-theory, usually requiring amenability, or at least some form of K-amenability.

However, after some thinking, maybe including some physical thoughts too, in connection with what is smoothness and is that wished or not, in the present situation, all this is normal. So, no worries, and as we will soon discover, we will get away with the tools that we have, namely Laplace operator and the Weingarten formula, which are not that bad, technically speaking, for all the problems that we will choose to solve.

CHAPTER 3

Fine structure

3a. Diagrams, easiness

We have so far a beginning of free geometry, in the real case with a triple of basic objects $(S_{\mathbb{R},+}^{N-1}, O_N^+, T_N^+)$, and in the complex case with objects $(S_{\mathbb{C},+}^{N-1}, U_N^+, \mathbb{T}_N^+)$. This is not bad, and our purpose in what follows will be that of expanding these two collections of objects, from 3 items each, to 10, 100, 1000, or as many as we can, and the more the merrier, in the name of pure mathematics, where new objects are always welcome.

This being said, what to start with? Leaving aside the tori, which are just duals of discrete groups, and as old as modern mathematics, we face a choice between spheres S , and rotation groups U . As a first observation, these two types of objects are closely related, because in the classical case, given a sphere S , we can recover U as being its isometry group, and conversely, given a group U , we can recover S just by rotating a point. And, as seen in chapter 2, the situation is quite similar in the free case.

This being said, spheres S are not the same thing as rotation groups U , and we will have to make a choice. Normally spheres S look a bit more important, but on the other hand physics, or even mathematics, tell us that no matter what we want to do, of advanced type, about either S or U , we will always end up in struggling with U .

So, we will go for U , and our goal in this chapter will be that of better understanding O_N^+, U_N^+ , and also look for more free quantum groups, as many as we can find. And regarding spheres S and other such manifolds, we will leave this for later. Sounds good, doesn't it? Before getting into this, however, let us check with physics and cat:

CAT 3.1. Gauge invariance gives you everything. But don't forget to do some manifolds too, all our kittens learn that, and it's good learning.

Thanks cat, this is a pleasure to hear, and in tune with my mathematical intuition. Getting started now, we would like to have a better understanding of the liberation operations that we have, $O_N \rightarrow O_N^+$ and $U_N \rightarrow U_N^+$, and also have more examples of liberation operations of the same type, $G_N \rightarrow G_N^+$. And then, once we will have enough theory and examples, look for classification results for the free quantum groups $\{G_N^+\}$.

Let us start with the construction of more examples, which is certainly a very exciting business, and leave the abstractions for later. Following Wang [89], we first have:

PROPOSITION 3.2. *Consider the symmetric group S_N , viewed as permutation group of the N coordinate axes of \mathbb{R}^N . The coordinate functions on $S_N \subset O_N$ are given by*

$$u_{ij} = \chi \left(\sigma \in G \mid \sigma(j) = i \right)$$

and the matrix $u = (u_{ij})$ that these functions form is magic, in the sense that its entries are projections ($p^2 = p^* = p$), summing up to 1 on each row and each column.

PROOF. The action of S_N on the standard basis $e_1, \dots, e_N \in \mathbb{R}^N$ being given by $\sigma : e_j \rightarrow e_{\sigma(j)}$, this gives the formula of u_{ij} in the statement. As for the fact that the matrix $u = (u_{ij})$ that these functions form is magic, this is clear. \square

With a bit more effort, we obtain the following nice characterization of S_N :

PROPOSITION 3.3. *The algebra of functions on S_N has the following presentation,*

$$C(S_N) = C_{comm}^* \left((u_{ij})_{i,j=1,\dots,N} \mid u = \text{magic} \right)$$

and the multiplication, unit and inversion map of S_N appear from the maps

$$\Delta(u_{ij}) = \sum_k u_{ik} \otimes u_{kj} \quad , \quad \varepsilon(u_{ij}) = \delta_{ij} \quad , \quad S(u_{ij}) = u_{ji}$$

defined at the algebraic level, of functions on S_N , by transposing.

PROOF. The universal algebra A in the statement being commutative, by the Gelfand theorem it must be of the form $A = C(X)$, with X being a certain compact space. Now since we have coordinates $u_{ij} : X \rightarrow \mathbb{R}$, we have an embedding $X \subset M_N(\mathbb{R})$. Also, since we know that these coordinates form a magic matrix, the elements $g \in X$ must be 0-1 matrices, having exactly one 1 entry on each row and each column, and so $X = S_N$. Thus we have proved the first assertion, and the second assertion is clear as well. \square

Still following Wang [89], we can now liberate S_N , as follows:

THEOREM 3.4. *The following universal C^* -algebra, with magic meaning as usual formed by projections ($p^2 = p^* = p$), summing up to 1 on each row and each column,*

$$C(S_N^+) = C^* \left((u_{ij})_{i,j=1,\dots,N} \mid u = \text{magic} \right)$$

is a Woronowicz algebra, with comultiplication, counit and antipode given by:

$$\Delta(u_{ij}) = \sum_k u_{ik} \otimes u_{kj} \quad , \quad \varepsilon(u_{ij}) = \delta_{ij} \quad , \quad S(u_{ij}) = u_{ji}$$

Thus the space S_N^+ is a compact quantum group, called quantum permutation group.

PROOF. As a first observation, the universal C^* -algebra in the statement is indeed well-defined, because the conditions $p^2 = p^* = p$ satisfied by the coordinates give:

$$\|u_{ij}\| \leq 1$$

In order to prove now that we have a Woronowicz algebra, we must construct maps Δ, ε, S given by the formulae in the statement. Consider the following matrices:

$$u_{ij}^\Delta = \sum_k u_{ik} \otimes u_{kj} \quad , \quad u_{ij}^\varepsilon = \delta_{ij} \quad , \quad u_{ij}^S = u_{ji}$$

Our claim is that, since u is magic, so are these three matrices. Indeed, regarding u^Δ , its entries are idempotents, as shown by the following computation:

$$(u_{ij}^\Delta)^2 = \sum_{kl} u_{ik} u_{il} \otimes u_{kj} u_{lj} = \sum_{kl} \delta_{kl} u_{ik} \otimes \delta_{kl} u_{kj} = u_{ij}^\Delta$$

These elements are self-adjoint as well, as shown by the following computation:

$$(u_{ij}^\Delta)^* = \sum_k u_{ik}^* \otimes u_{kj}^* = \sum_k u_{ik} \otimes u_{kj} = u_{ij}^\Delta$$

The row and column sums for the matrix u^Δ can be computed as follows:

$$\begin{aligned} \sum_j u_{ij}^\Delta &= \sum_{jk} u_{ik} \otimes u_{kj} = \sum_k u_{ik} \otimes 1 = 1 \\ \sum_i u_{ij}^\Delta &= \sum_{ik} u_{ik} \otimes u_{kj} = \sum_k 1 \otimes u_{kj} = 1 \end{aligned}$$

Thus, u^Δ is magic. Regarding now u^ε, u^S , these matrices are magic too, and this for obvious reasons. Thus, all our three matrices $u^\Delta, u^\varepsilon, u^S$ are magic, so we can define Δ, ε, S by the formulae in the statement, by using the universality property of $C(S_N^+)$. \square

Our first task now is to make sure that Theorem 3.4 produces indeed a new quantum group, which does not collapse to S_N . Still following Wang [89], we have:

THEOREM 3.5. *We have an embedding $S_N \subset S_N^+$, given at the algebra level by:*

$$u_{ij} \rightarrow \chi \left(\sigma \in S_N \mid \sigma(j) = i \right)$$

This is an isomorphism at $N \leq 3$, but not at $N \geq 4$, where S_N^+ is not classical, nor finite.

PROOF. The fact that we have indeed an embedding as above follows from Proposition 3.3. Observe that in fact more is true, because our results above give:

$$C(S_N) = C(S_N^+) / \langle ab = ba \rangle$$

Thus, the inclusion $S_N \subset S_N^+$ is a “liberation”, in the sense that S_N is the classical version of S_N^+ . We will often use this basic fact, in what follows. Regarding now the second assertion, we can prove this in four steps, as follows:

Case $N = 2$. The fact that S_2^+ is indeed classical, and hence collapses to S_2 , is trivial, because the 2×2 magic matrices are as follows, with p being a projection:

$$U = \begin{pmatrix} p & 1-p \\ 1-p & p \end{pmatrix}$$

Indeed, this shows that the entries of U commute. Thus $C(S_2^+)$ is commutative, and so equals its biggest commutative quotient, which is $C(S_2)$. Thus, $S_2^+ = S_2$.

Case $N = 3$. By using the same argument as in the $N = 2$ case, and the symmetries of the problem, it is enough to check that u_{11}, u_{22} commute. But this follows from:

$$\begin{aligned} u_{11}u_{22} &= u_{11}u_{22}(u_{11} + u_{12} + u_{13}) \\ &= u_{11}u_{22}u_{11} + u_{11}u_{22}u_{13} \\ &= u_{11}u_{22}u_{11} + u_{11}(1 - u_{21} - u_{23})u_{13} \\ &= u_{11}u_{22}u_{11} \end{aligned}$$

Indeed, by applying the involution to this formula, we obtain that we have as well $u_{22}u_{11} = u_{11}u_{22}u_{11}$. Thus, we obtain $u_{11}u_{22} = u_{22}u_{11}$, as desired.

Case $N = 4$. Consider the following matrix, with p, q being projections:

$$U = \begin{pmatrix} p & 1-p & 0 & 0 \\ 1-p & p & 0 & 0 \\ 0 & 0 & q & 1-q \\ 0 & 0 & 1-q & q \end{pmatrix}$$

This matrix is magic, and we can choose $p, q \in B(H)$ as for the algebra $\langle p, q \rangle$ to be noncommutative and infinite dimensional. We conclude that $C(S_4^+)$ is noncommutative and infinite dimensional as well, and so S_4^+ is non-classical and infinite, as claimed.

Case $N \geq 5$. Here we can use the standard embedding $S_4^+ \subset S_N^+$, obtained at the level of the corresponding magic matrices in the following way:

$$u \rightarrow \begin{pmatrix} u & 0 \\ 0 & 1_{N-4} \end{pmatrix}$$

Indeed, with this in hand, the fact that S_4^+ is a non-classical, infinite compact quantum group implies that S_N^+ with $N \geq 5$ has these two properties as well. \square

With the above results in hand, we can introduce as well quantum reflections:

THEOREM 3.6. *The following constructions produce compact quantum groups,*

$$\begin{aligned} C(H_N^+) &= C^* \left((u_{ij})_{i,j=1,\dots,N} \mid u_{ij} = u_{ij}^*, (u_{ij}^2) = \text{magic} \right) \\ C(K_N^+) &= C^* \left((u_{ij})_{i,j=1,\dots,N} \mid [u_{ij}, u_{ij}^*] = 0, (u_{ij}u_{ij}^*) = \text{magic} \right) \end{aligned}$$

which appear as liberations of the reflection groups $H_N = \mathbb{Z}_2 \wr S_N$ and $K_N = \mathbb{T} \wr S_N$.

PROOF. This can be proved in the usual way, with the first assertion coming from the fact that if u satisfies the relations in the statement, then so do the matrices $u^\Delta, u^\varepsilon, u^S$, and with the second assertion being trivial. Let us also mention that, in analogy with $H_N = \mathbb{Z}_2 \wr S_N$ and $K_N = \mathbb{T} \wr S_N$, we have decomposition results as follows:

$$H_N^+ = \mathbb{Z}_2 \wr_* S_N^+ \quad , \quad K_N^+ = \mathbb{T} \wr_* S_N^+$$

To be more precise, here \wr_* is a free wreath product, and these formulae can be established a bit as in the classical case. For more on all this, we refer to [8]. \square

All the above is very nice, and as a conclusion to all this, let us record the following result, which collects and refines the various liberation statements formulated above:

THEOREM 3.7. *The quantum unitary and reflection groups are as follows,*

and in this diagram, any face $P \subset Q, R \subset S$ has the property $P = Q \cap R$.

PROOF. The fact that we have inclusions as in the statement follows from the definition of the various quantum groups involved. As for the various intersection claims, these follow as well from definitions. For some further details on all this, we refer to [8]. \square

As a comment here, observe that the symmetric group S_N and its free analogue S_N^+ , while certainly being very interesting objects, had not made the cut for appearing in the above almighty cube, called “standard cube” in quantum algebra. However, this is something quite natural, because S_N and S_N^+ are objects on their own, neither real or complex, and for practical purposes, like ours with our cube, these quantum groups must be replaced with H_N, H_N^+ in the real case, and with K_N, K_N^+ in the free case.

Actually I’m not quite sure about this, time to ask the cat. Who says:

CAT 3.8. *Do not worry, the high speed world is projective anyway, and it is better to use reflections instead of permutations.*

Thanks cat, not that I really understand what you say, but it fits with my purposes and cube, which looks really cool. But I will keep this in mind, and discuss later the relation between affine and projective geometry, in the free setting, that is promised.

With this done, let us get now into the second question that we were having, namely the conceptual understanding of the various liberation operations $G_N \rightarrow G_N^+$. In order to discuss this, we will need Tannakian duality, and Brauer type theorems. Let us start with Tannakian duality. This is a rather abstract statement, as follows:

THEOREM 3.9. *The following operations are inverse to each other:*

- (1) *The construction $G \rightarrow C$, which associates to a closed subgroup $G \subset_u U_N^+$ the tensor category formed by the intertwiner spaces $C_{kl} = \text{Hom}(u^{\otimes k}, u^{\otimes l})$.*
- (2) *The construction $C \rightarrow G$, associating to a tensor category C the closed subgroup $G \subset_u U_N^+$ coming from the relations $T \in \text{Hom}(u^{\otimes k}, u^{\otimes l})$, with $T \in C_{kl}$.*

PROOF. We have indeed a construction $G \rightarrow C_G$, whose output is a subcategory of the tensor C^* -category of finite dimensional Hilbert spaces, as follows:

$$(C_G)_{kl} = \text{Hom}(u^{\otimes k}, u^{\otimes l})$$

We have as well a construction $C \rightarrow G_C$, obtained by setting:

$$C(G_C) = C(U_N^+) / \left\langle T \in \text{Hom}(u^{\otimes k}, u^{\otimes l}) \mid \forall k, l, \forall T \in C_{kl} \right\rangle$$

Regarding now the bijection claim, some elementary algebra shows that $C = C_{G_C}$ implies $G = G_{C_G}$, and that $C \subset C_{G_C}$ is automatic. Thus we are left with proving:

$$C_{G_C} \subset C$$

But this latter inclusion can be proved indeed, by doing some algebra, and using von Neumann's bicommutant theorem, in finite dimensions. \square

The above result is something quite abstract, yet powerful. We will see applications of it in a moment, in the form of Brauer theorems for S_N, O_N, U_N and S_N^+, O_N^+, U_N^+ , and other quantum groups. In order to formulate these Brauer theorems, let us start with:

DEFINITION 3.10. *Let $P(k, l)$ be the set of partitions between an upper row of k points, and a lower row of l points. A collection of sets*

$$D = \bigsqcup_{k, l} D(k, l)$$

with $D(k, l) \subset P(k, l)$ is called a category of partitions when it has the following properties:

- (1) *Stability under the horizontal concatenation, $(\pi, \sigma) \rightarrow [\pi\sigma]$.*
- (2) *Stability under the vertical concatenation, $(\pi, \sigma) \rightarrow \left[\begin{smallmatrix} \sigma \\ \pi \end{smallmatrix} \right]$.*
- (3) *Stability under the upside-down turning, $\pi \rightarrow \pi^*$.*
- (4) *Each set $P(k, k)$ contains the identity partition $|| \dots ||$.*
- (5) *The sets $P(\emptyset, \bullet)$ and $P(\emptyset, \bullet\bullet)$ both contain the semicircle \cap .*

As a basic example, we have the category of all partitions P itself. Other basic examples are the category of pairings P_2 , and the categories NC, NC_2 of noncrossing partitions, and pairings. We have as well the category \mathcal{P}_2 of pairings which are “matching”, in the sense that they connect $\circ - \circ, \bullet - \bullet$ on the vertical, and $\circ - \bullet$ on the horizontal, and its subcategory $\mathcal{NC}_2 \subset \mathcal{P}_2$ consisting of the noncrossing matching pairings.

There are many other examples, and we will be back to this, gradually, in what follows. Regarding now the relation with the Tannakian categories, this comes from:

PROPOSITION 3.11. *Each partition $\pi \in P(k, l)$ produces a linear map*

$$T_\pi : (\mathbb{C}^N)^{\otimes k} \rightarrow (\mathbb{C}^N)^{\otimes l}$$

given by the following formula, with e_1, \dots, e_N being the standard basis of \mathbb{C}^N ,

$$T_\pi(e_{i_1} \otimes \dots \otimes e_{i_k}) = \sum_{j_1 \dots j_l} \delta_\pi \begin{pmatrix} i_1 & \dots & i_k \\ j_1 & \dots & j_l \end{pmatrix} e_{j_1} \otimes \dots \otimes e_{j_l}$$

and with the Kronecker type symbols $\delta_\pi \in \{0, 1\}$ depending on whether the indices fit or not. The assignment $\pi \rightarrow T_\pi$ is categorical, in the sense that we have

$$T_\pi \otimes T_\sigma = T_{[\pi\sigma]} \quad , \quad T_\pi T_\sigma = N^{c(\pi, \sigma)} T_{[\frac{\sigma}{\pi}]} \quad , \quad T_\pi^* = T_{\pi^*}$$

where $c(\pi, \sigma)$ are certain integers, coming from the erased components in the middle.

PROOF. The concatenation axiom follows from the following computation:

$$\begin{aligned} & (T_\pi \otimes T_\sigma)(e_{i_1} \otimes \dots \otimes e_{i_p} \otimes e_{k_1} \otimes \dots \otimes e_{k_r}) \\ &= \sum_{j_1 \dots j_q} \sum_{l_1 \dots l_s} \delta_\pi \begin{pmatrix} i_1 & \dots & i_p \\ j_1 & \dots & j_q \end{pmatrix} \delta_\sigma \begin{pmatrix} k_1 & \dots & k_r \\ l_1 & \dots & l_s \end{pmatrix} e_{j_1} \otimes \dots \otimes e_{j_q} \otimes e_{l_1} \otimes \dots \otimes e_{l_s} \\ &= \sum_{j_1 \dots j_q} \sum_{l_1 \dots l_s} \delta_{[\pi\sigma]} \begin{pmatrix} i_1 & \dots & i_p & k_1 & \dots & k_r \\ j_1 & \dots & j_q & l_1 & \dots & l_s \end{pmatrix} e_{j_1} \otimes \dots \otimes e_{j_q} \otimes e_{l_1} \otimes \dots \otimes e_{l_s} \\ &= T_{[\pi\sigma]}(e_{i_1} \otimes \dots \otimes e_{i_p} \otimes e_{k_1} \otimes \dots \otimes e_{k_r}) \end{aligned}$$

As for the composition and involution axioms, their proof is similar. \square

In relation now with quantum groups, we have the following result:

THEOREM 3.12. *Each category of partitions $D = (D(k, l))$ produces a family of compact quantum groups $G = (G_N)$, one for each $N \in \mathbb{N}$, via the formula*

$$\text{Hom}(u^{\otimes k}, u^{\otimes l}) = \text{span} \left(T_\pi \Big|_{\pi \in D(k, l)} \right)$$

which produces a Tannakian category, and so a closed subgroup $G_N \subset_u U_N^+$.

PROOF. Let call C_{kl} the spaces on the right. By using the axioms in Definition 3.10, and the categorical properties of the operation $\pi \rightarrow T_\pi$, from Proposition 3.11, we see that $C = (C_{kl})$ is a Tannakian category. Thus Theorem 3.9 applies, and gives the result. \square

We can now formulate a key definition, as follows:

DEFINITION 3.13. *A compact quantum group G_N is called easy when we have*

$$\text{Hom}(u^{\otimes k}, u^{\otimes l}) = \text{span} \left(T_\pi \mid \pi \in D(k, l) \right)$$

for any colored integers k, l , for a certain category of partitions $D \subset P$.

In other words, a compact quantum group is called easy when its Tannakian category appears in the simplest possible way: from a category of partitions. The terminology is quite natural, because Tannakian duality is basically our only serious tool. In relation now with the orthogonal, unitary and symmetric quantum groups, here is the result:

THEOREM 3.14. *The basic quantum permutation and rotation groups,*

$$\begin{array}{ccccc} S_N^+ & \longrightarrow & O_N^+ & \longrightarrow & U_N^+ \\ \uparrow & & \uparrow & & \uparrow \\ S_N & \longrightarrow & O_N & \longrightarrow & U_N \end{array}$$

are all easy, the corresponding categories of partitions being as follows,

$$\begin{array}{ccccc} NC & \longleftarrow & NC_2 & \longleftarrow & \mathcal{NC}_2 \\ \downarrow & & \downarrow & & \downarrow \\ P & \longleftarrow & P_2 & \longleftarrow & \mathcal{P}_2 \end{array}$$

with 2 standing for pairings, NC for noncrossing, and calligraphic for matching.

PROOF. This is something quite fundamental, the proof being as follows:

(1) The quantum group U_N^+ is defined via the following relations:

$$u^* = u^{-1} \quad , \quad u^t = \bar{u}^{-1}$$

But, by doing some elementary computations, these relations tell us precisely that the following two operators must be in the associated Tannakian category C :

$$T_\pi \quad : \quad \pi = \begin{array}{c} \cap \\ \circ \bullet \end{array} , \quad \begin{array}{c} \cap \\ \bullet \circ \end{array}$$

Thus, the associated Tannakian category is $C = \text{span}(T_\pi \mid \pi \in D)$, with:

$$D = \langle \begin{array}{c} \cap \\ \circ \bullet \end{array} , \begin{array}{c} \cap \\ \bullet \circ \end{array} \rangle = \mathcal{NC}_2$$

(2) The subgroup $O_N^+ \subset U_N^+$ is defined by imposing the following relations:

$$u_{ij} = \bar{u}_{ij}$$

Thus, the following operators must be in the associated Tannakian category C :

$$T_\pi \quad : \quad \pi = \begin{array}{c} \updownarrow \\ \updownarrow \end{array}, \begin{array}{c} \updownarrow \\ \updownarrow \end{array}$$

We conclude that the Tannakian category is $C = \text{span}(T_\pi | \pi \in D)$, with:

$$D = \langle \mathcal{NC}_2, \begin{array}{c} \updownarrow \\ \updownarrow \end{array}, \begin{array}{c} \updownarrow \\ \updownarrow \end{array} \rangle = \mathcal{NC}_2$$

(3) The subgroup $U_N \subset U_N^+$ is defined via the following relations:

$$[u_{ij}, u_{kl}] = 0 \quad , \quad [u_{ij}, \bar{u}_{kl}] = 0$$

Thus, the following operators must be in the associated Tannakian category C :

$$T_\pi \quad : \quad \pi = \begin{array}{c} \updownarrow \\ \updownarrow \end{array}, \begin{array}{c} \updownarrow \\ \updownarrow \end{array}$$

Thus the associated Tannakian category is $C = \text{span}(T_\pi | \pi \in D)$, with:

$$D = \langle \mathcal{NC}_2, \begin{array}{c} \updownarrow \\ \updownarrow \end{array}, \begin{array}{c} \updownarrow \\ \updownarrow \end{array} \rangle = \mathcal{P}_2$$

(4) In order to deal now with O_N , we can simply use the following formula:

$$O_N = O_N^+ \cap U_N$$

At the categorical level, this tells us that O_N is indeed easy, coming from:

$$D = \langle \mathcal{NC}_2, \mathcal{P}_2 \rangle = \mathcal{P}_2$$

(5) We know that the subgroup $S_N^+ \subset O_N^+$ appears as follows:

$$C(S_N^+) = C(O_N^+) / \langle u = \text{magic} \rangle$$

In order to interpret the magic condition, consider the fork partition:

$$Y \in P(2, 1)$$

Given a corepresentation u , we have the following formulae:

$$(T_Y u^{\otimes 2})_{i,jk} = \sum_{lm} (T_Y)_{i,lm} (u^{\otimes 2})_{lm,jk} = u_{ij} u_{ik}$$

$$(u T_Y)_{i,jk} = \sum_l u_{il} (T_Y)_{l,jk} = \delta_{jk} u_{ij}$$

We conclude that we have the following equivalence:

$$T_Y \in \text{Hom}(u^{\otimes 2}, u) \iff u_{ij} u_{ik} = \delta_{jk} u_{ij}, \forall i, j, k$$

The condition on the right being equivalent to the magic condition, we obtain:

$$C(S_N^+) = C(O_N^+) / \langle T_Y \in \text{Hom}(u^{\otimes 2}, u) \rangle$$

Thus S_N^+ is indeed easy, the corresponding category of partitions being:

$$D = \langle Y \rangle = NC$$

(6) Finally, in order to deal with S_N , we can use the following formula:

$$S_N = S_N^+ \cap O_N$$

At the categorical level, this tells us that S_N is indeed easy, coming from:

$$D = \langle NC, P_2 \rangle = P$$

Thus, we are led to the conclusions in the statement. \square

Moving ahead, we can upgrade what we have into a cube result, as follows:

THEOREM 3.15. *The basic quantum unitary and reflection groups,*

$$\begin{array}{ccccc}
 & & K_N^+ & \longrightarrow & U_N^+ \\
 & & \uparrow & & \uparrow \\
 H_N^+ & \longrightarrow & O_N^+ & \longrightarrow & U_N^+ \\
 & & \uparrow & & \uparrow \\
 & & K_N & \longrightarrow & U_N \\
 & & \uparrow & & \uparrow \\
 H_N & \longrightarrow & O_N & \longrightarrow & U_N
 \end{array}$$

are all easy, and the corresponding categories of partitions form an intersection diagram.

PROOF. The precise claim is that the categories are as follows, with P_{even} being the category of partitions having even blocks, and with $\mathcal{P}_{\text{even}}(k, l) \subset P_{\text{even}}(k, l)$ consisting of the partitions satisfying $\# \circ = \# \bullet$ in each block, when flattening the partition:

$$\begin{array}{ccccc}
 & & \mathcal{NC}_{\text{even}} & \longleftarrow & \mathcal{NC}_2 \\
 & & \swarrow & & \swarrow \\
 \mathcal{NC}_{\text{even}} & \longleftarrow & & \longleftarrow & \mathcal{NC}_2 \\
 & & \downarrow & & \downarrow \\
 & & \mathcal{P}_{\text{even}} & \longleftarrow & \mathcal{P}_2 \\
 & & \swarrow & & \swarrow \\
 P_{\text{even}} & \longleftarrow & & \longleftarrow & P_2
 \end{array}$$

But this is something that we already know for the right face, from Theorem 3.14, and in what regards the left face, the proof here is similar, by using the results for S_N, S_N^+ from that same Theorem 3.14. As for the last assertion, this is something trivial. \square

The above results are something quite deep, and we will see in what follows countless applications of them. As a first such application, rather philosophical, we have:

THEOREM 3.16. *The constructions $G_N \rightarrow G_N^+$ with $G = O, U, S, H, K$ are easy quantum group liberations, in the sense that they come from the construction*

$$D \rightarrow D \cap NC$$

at the level of the associated categories of partitions.

PROOF. This is clear indeed from Theorem 3.14 and Theorem 3.15, and from the following trivial equalities, connecting the categories found there:

$$NC_2 = P_2 \cap NC \quad , \quad \mathcal{NC}_2 = \mathcal{P}_2 \cap NC$$

$$NC = P \cap NC$$

$$NC_{\text{even}} = P_{\text{even}} \cap NC \quad , \quad \mathcal{NC}_{\text{even}} = \mathcal{P}_{\text{even}} \cap NC$$

Thus, we are led to the conclusion in the statement. \square

The above result is quite nice, because the various constructions $G_N \rightarrow G_N^+$ that we made so far, although natural, were something quite ad-hoc. Now all this is no longer ad-hoc, and the next time that we will have to liberate a subgroup $G_N \subset U_N$, we know what the recipe is, namely check if G_N is easy, and if so, simply define $G_N^+ \subset U_N^+$ as being the easy quantum group coming from the category $D = D_G \cap NC$.

3b. Uniformity, characters

In general, the study of the free quantum groups, in the “easy” sense explained above, is something quite complex. In order to cut a bit from complexity, we will use:

PROPOSITION 3.17. *For an easy quantum group $G = (G_N)$, coming from a category of partitions $D \subset P$, the following conditions are equivalent:*

- (1) $G_{N-1} = G_N \cap U_{N-1}^+$, via the embedding $U_{N-1}^+ \subset U_N^+$ given by $u \rightarrow \text{diag}(u, 1)$.
- (2) $G_{N-1} = G_N \cap U_{N-1}^+$, via the N possible diagonal embeddings $U_{N-1}^+ \subset U_N^+$.
- (3) D is stable under the operation which consists in removing blocks.

PROOF. We use the general easiness theory, as explained above:

(1) \iff (2) This is something standard, coming from the inclusion $S_N \subset G_N$, which makes everything S_N -invariant. The result follows as well from the proof of (1) \iff (3) below, which can be converted into a proof of (2) \iff (3), in the obvious way.

(1) \iff (3) Given a subgroup $K \subset U_{N-1}^+$, with fundamental corepresentation u , consider the $N \times N$ matrix $v = \text{diag}(u, 1)$. Our claim is that for any $\pi \in P(k)$ we have:

$$\xi_\pi \in \text{Fix}(v^{\otimes k}) \iff \xi_{\pi'} \in \text{Fix}(v^{\otimes k'}), \forall \pi' \in P(k'), \pi' \subset \pi$$

In order to prove this, we must study the condition on the left. We have:

$$\begin{aligned}
\xi_\pi \in \text{Fix}(v^{\otimes k}) &\iff (v^{\otimes k} \xi_\pi)_{i_1 \dots i_k} = (\xi_\pi)_{i_1 \dots i_k}, \forall i \\
&\iff \sum_j (v^{\otimes k})_{i_1 \dots i_k, j_1 \dots j_k} (\xi_\pi)_{j_1 \dots j_k} = (\xi_\pi)_{i_1 \dots i_k}, \forall i \\
&\iff \sum_j \delta_\pi(j_1, \dots, j_k) v_{i_1 j_1} \dots v_{i_k j_k} = \delta_\pi(i_1, \dots, i_k), \forall i
\end{aligned}$$

Now let us recall that our corepresentation has the special form $v = \text{diag}(u, 1)$. We conclude from this that for any index $a \in \{1, \dots, k\}$, we must have:

$$i_a = N \implies j_a = N$$

With this observation in hand, if we denote by i', j' the multi-indices obtained from i, j obtained by erasing all the above $i_a = j_a = N$ values, and by $k' \leq k$ the common length of these new multi-indices, our condition becomes:

$$\sum_{j'} \delta_\pi(j_1, \dots, j_k) (v^{\otimes k'})_{i' j'} = \delta_\pi(i_1, \dots, i_k), \forall i$$

Here the index j is by definition obtained from j' by filling with N values. In order to finish now, we have two cases, depending on i , as follows:

Case 1. Assume that the index set $\{a | i_a = N\}$ corresponds to a certain subpartition $\pi' \subset \pi$. In this case, the N values will not matter, and our formula becomes:

$$\sum_{j'} \delta_\pi(j'_1, \dots, j'_{k'}) (v^{\otimes k'})_{i' j'} = \delta_\pi(i'_1, \dots, i'_{k'})$$

Case 2. Assume now the opposite, namely that the set $\{a | i_a = N\}$ does not correspond to a subpartition $\pi' \subset \pi$. In this case the indices mix, and our formula reads:

$$0 = 0$$

Thus, we are led to $\xi_{\pi'} \in \text{Fix}(v^{\otimes k'})$, for any subpartition $\pi' \subset \pi$, as claimed. Thus our claim is proved, and with this in hand, the result follows from Tannakian duality. \square

Based on the above result, let us formulate the following definition:

DEFINITION 3.18. *An easy quantum group $G = (G_N)$, coming from a category of partitions $D \subset P$, is called uniform when we have, for any $N \in \mathbb{N}$:*

$$G_{N-1} = G_N \cap U_{N-1}^+$$

Equivalently, D must be stable under the operation which consists in removing blocks.

For classification purposes the uniformity axiom is something very natural and useful, substantially cutting from complexity, and we have the following result:

THEOREM 3.19. *The classical and free uniform orthogonal easy quantum groups are*

with B_N, B_N^+ being the classical and quantum bistochastic groups.

PROOF. There are several things to be proved, the idea being as follows:

(1) We first recall that the bistochastic group $B_N \subset O_N$ consists of the orthogonal matrices whose entries sum up to 1 on each row, or equivalently, sum up to 1 on each column. Thus, if we denote by $\xi \in \mathbb{C}^N$ the all-one vector, we have:

$$B_N = \{U \in O_N \mid U\xi = \xi\}$$

Based on this, we can construct a free analogue of B_N as follows, and the fact that we obtain indeed a quantum group follows exactly as for O_N^+, U_N^+ :

$$C(B_N^+) = C(O_N^+) / \langle u\xi = \xi \rangle$$

(2) Since the relation $u\xi = \xi$ reads $T_{|} \in \text{Fix}(u)$, with $| \in P(0, 1)$ being the singleton partition, we conclude that B_N, B_N^+ are easy, coming from the categories P_{12}, NC_{12} of singletons and pairings, and noncrossing singletons and pairings. Thus, all the quantum groups in the statement are easy, the corresponding categories of partitions being:

(3) Regarding now the classification, consider an easy quantum group $S_N \subset G_N \subset O_N$. This must come from a category $P_2 \subset D \subset P$, and if we assume $G = (G_N)$ to be uniform,

then D is uniquely determined by the subset $L \subset \mathbb{N}$ consisting of the sizes of the blocks of the partitions in D . Our claim is that the admissible sets are as follows:

- $L = \{2\}$, producing O_N .
- $L = \{1, 2\}$, producing B_N .
- $L = \{2, 4, 6, \dots\}$, producing H_N .
- $L = \{1, 2, 3, \dots\}$, producing S_N .

(4) Indeed, in one sense, this follows from our easiness results for O_N, B_N, H_N, S_N . In the other sense now, assume that $L \subset \mathbb{N}$ is such that the set P_L consisting of partitions whose sizes of the blocks belong to L is a category of partitions. We know from the axioms of the categories of partitions that the semicircle \cap must be in the category, so we have $2 \in L$. We claim that the following conditions must be satisfied as well:

$$k, l \in L, k > l \implies k - l \in L$$

$$k \in L, k \geq 2 \implies 2k - 2 \in L$$

(5) Indeed, we will prove that both conditions follow from the axioms of the categories of partitions. Let us denote by $b_k \in P(0, k)$ the one-block partition:

$$b_k = \left\{ \begin{array}{cccc} \cap \cap & \dots & \cap & \\ 1 & 2 & \dots & k \end{array} \right\}$$

For $k > l$, we can write b_{k-l} in the following way:

$$b_{k-l} = \left\{ \begin{array}{cccccc} \cap \cap & \dots & \dots & \dots & \dots & \cap \\ 1 & 2 & \dots & l & l+1 & \dots & k \\ \sqcup \sqcup & \dots & \sqcup & | & \dots & | & \\ & & & 1 & \dots & k-l & \end{array} \right\}$$

In other words, we have the following formula:

$$b_{k-l} = (b_l^* \otimes |\otimes^{k-l}|) b_k$$

Since all the terms of this composition are in P_L , we have $b_{k-l} \in P_L$, and this proves our first claim. As for the second claim, this can be proved in a similar way, by capping two adjacent k -blocks with a 2-block, in the middle.

(6) With these conditions in hand, we can conclude in the following way:

Case 1. Assume $1 \in L$. By using the first condition with $l = 1$ we get:

$$k \in L \implies k - 1 \in L$$

This condition shows that we must have $L = \{1, 2, \dots, m\}$, for a certain number $m \in \{1, 2, \dots, \infty\}$. On the other hand, by using the second condition we get:

$$\begin{aligned} m \in L &\implies 2m - 2 \in L \\ &\implies 2m - 2 \leq m \\ &\implies m \in \{1, 2, \infty\} \end{aligned}$$

The case $m = 1$ being excluded by the condition $2 \in L$, we reach to one of the two sets producing the groups S_N, B_N .

Case 2. Assume $1 \notin L$. By using the first condition with $l = 2$ we get:

$$k \in L \implies k - 2 \in L$$

This condition shows that we must have $L = \{2, 4, \dots, 2p\}$, for a certain number $p \in \{1, 2, \dots, \infty\}$. On the other hand, by using the second condition we get:

$$\begin{aligned} 2p \in L &\implies 4p - 2 \in L \\ &\implies 4p - 2 \leq 2p \\ &\implies p \in \{1, \infty\} \end{aligned}$$

Thus L must be one of the two sets producing O_N, H_N , and we are done. In the free case, $S_N^+ \subset G_N \subset O_N^+$, the situation is quite similar, the admissible sets being once again the above ones, producing this time $O_N^+, B_N^+, H_N^+, S_N^+$. \square

When removing the uniformity axiom things become more complicated, as follows:

THEOREM 3.20. *The classical and free orthogonal easy quantum groups are*

$$\begin{array}{ccccc} & & H_N^+ & \longrightarrow & O_N^+ \\ & \nearrow S_N^+ & \uparrow & & \nearrow B_N^+ \\ S_N^+ & \longrightarrow & B_N^+ & & O_N^+ \\ & \nearrow S_N' & \uparrow H_N & \longrightarrow & \nearrow O_N \\ S_N & \longrightarrow & B_N & & O_N \\ & \nearrow S_N' & \uparrow & & \nearrow B_N' \end{array}$$

with $S_N' = S_N \times \mathbb{Z}_2$, $B_N' = B_N \times \mathbb{Z}_2$, and with S_N^+, B_N^+ being their liberations, where B_N^+ stands for the two possible such liberations, $B_N^+ \subset B_N'^+$.

PROOF. The idea here is that of jointly classifying the ‘‘classical’’ categories of partitions $P_2 \subset D \subset P$, and the ‘‘free’’ ones $NC_2 \subset D \subset NC$:

(1) At the classical level this leads, via a study which is quite similar to that from the proof of Theorem 3.19, to 2 more groups, namely S'_N, B'_N .

(2) At the free level we obtain 3 more quantum groups, $S_N^+, B_N^+, B_N''^+$, with the inclusion $B_N^+ \subset B_N''^+$, which is something a bit surprising, being best thought of as coming from an inclusion $B'_N \subset B_N''$, which happens to be an isomorphism. \square

It is possible to obtain similar results in the general unitary case, first with a quite simple statement, regarding the uniform case, and then with something more complicated, regarding the non-uniform case. We refer here to the paper of Tarrago-Weber [80].

Importantly, the uniformity assumption has some interesting analytic consequences, making the link with the Bercovici-Pata bijection [19]. In order to discuss this, we first need to know how to integrate on the easy quantum groups, and we have here:

THEOREM 3.21. *Assuming that a closed subgroup $G \subset U_N^+$ is easy, coming from a category of partitions $D \subset P$, we have the Weingarten formula*

$$\int_G u_{i_1 j_1}^{e_1} \cdots u_{i_k j_k}^{e_k} = \sum_{\pi, \sigma \in D(k)} \delta_\pi(i) \delta_\sigma(j) W_{kN}(\pi, \sigma)$$

where $\delta \in \{0, 1\}$ are the usual Kronecker type symbols, and where the Weingarten matrix $W_{kN} = G_{kN}^{-1}$ is the inverse of the Gram matrix $G_{kN}(\pi, \sigma) = N^{|\pi \vee \sigma|}$.

PROOF. We know from the general theory in chapter 1 that the integrals in the statement form altogether the orthogonal projection P^k onto the following space:

$$Fix(u^{\otimes k}) = span \left(\xi_\pi \mid \pi \in D(k) \right)$$

In order to prove the result, consider the following linear map:

$$E(x) = \sum_{\pi \in D(k)} \langle x, \xi_\pi \rangle \xi_\pi$$

By a standard linear algebra computation, it follows that we have $P = WE$, where W is the inverse on $Fix(u^{\otimes k})$ of the restriction of E . But this restriction is the linear map given by G_{kN} , and so W is the linear map given by W_{kN} , and this gives the result. \square

In relation now with characters, we have the following moment formula:

PROPOSITION 3.22. *The moments of truncated characters are given by the formula*

$$\int_G (u_{11} + \cdots + u_{ss})^k = Tr(W_{kN} G_{ks})$$

where G_{kN} and $W_{kN} = G_{kN}^{-1}$ are the associated Gram and Weingarten matrices.

PROOF. We have indeed the following computation:

$$\begin{aligned}
 \int_G (u_{11} + \dots + u_{ss})^k &= \sum_{i_1=1}^s \dots \sum_{i_k=1}^s \int u_{i_1 i_1} \dots u_{i_k i_k} \\
 &= \sum_{\pi, \sigma \in D(k)} W_{kN}(\pi, \sigma) \sum_{i_1=1}^s \dots \sum_{i_k=1}^s \delta_\pi(i) \delta_\sigma(i) \\
 &= \sum_{\pi, \sigma \in D(k)} W_{kN}(\pi, \sigma) G_{ks}(\sigma, \pi) \\
 &= Tr(W_{kN} G_{ks})
 \end{aligned}$$

Thus, we have obtained the formula in the statement. □

With the above general theory in hand, we can now formulate our character results for the main examples of uniform easy quantum groups, as follows:

THEOREM 3.23. *For the main quantum rotation and reflection groups,*

the corresponding truncated characters follow with $N \rightarrow \infty$ the laws

which are the main limiting laws in classical and free probability.

PROOF. We know from Theorem 3.15 that the above quantum groups are all easy, coming from the following categories of partitions:

Now by using Proposition 3.22, we obtain the following formula:

$$\lim_{N \rightarrow \infty} \int_{G_N} \chi_t^k = \sum_{\pi \in D(k)} t^{|\pi|}$$

But this gives the laws in the statement, via some standard calculus. \square

3c. Temperley-Lieb

All the above is sweet, and there are many other things that can be said, along the same lines, about the liberation operations $G_N \rightarrow G_N^+$, using easiness and partitions. This being said, we are rather interested in free quantum groups, so we do not need partitions with crossings, and this leads us to a quite puzzling question, as follows:

QUESTION 3.24. *Among the many objects which are in bijection with the noncrossing partitions, which are the most adapted to the study of the free quantum groups?*

To be more precise here, in order to give you a taste on what this question is about, you have surely heard for instance about the Catalan numbers:

$$C_k = \frac{1}{k+1} \binom{2k}{k}$$

These Catalan numbers count the partitions in $NC(k)$, but they count as well a zillion other interesting things, just ask and any expert in combinatorics will probably get you stuck for 1 hour in the coffee room, in explaining you all this, and our problem is, among these zillion things, what are the best for the study of free quantum groups.

This does not look obvious, and so time to ask the cat. And cat says:

CAT 3.25. *You're getting old, double the strings as to have Temperley-Lieb diagrams, as in the heyday of free quantum group theory.*

Thanks cat, and yes indeed, age does not help much with knowledge and memory, in fact Question 3.24 is something that I already thought about, some 30 years ago, when developing the basic theory of free quantum groups. Following Temperley-Lieb, who by the way were first-class physicists, and then Jones, who was a first-class physicist too, and many others, including myself when younger, not to forget cat of course, we will of course go for this, doubling strings and using Temperley-Lieb diagrams.

Let us start with the following result, which is well-known:

PROPOSITION 3.26. *We have a bijection $NC(k) \simeq NC_2(2k)$, as follows:*

- (1) *The application $NC(k) \rightarrow NC_2(2k)$ is the “fattening” one, obtained by doubling all the legs, and doubling all the strings as well.*
- (2) *Its inverse $NC_2(2k) \rightarrow NC(k)$ is the “shrinking” application, obtained by collapsing pairs of consecutive neighbors.*

PROOF. The fact that the above two operations are indeed inverse to each other is clear, by drawing pictures, and computing the corresponding compositions. \square

With the above result in hand, we can axiomatize the free quantum groups, in terms of Temperley-Lieb diagrams NC_2 , and say many interesting things about them, based on the work of Jones and others on subfactor theory and planar algebras [64].

We can compute representations and their fusion rules, Cayley graphs, growth exponents, laws of characters and more, by using diagrams, and more specifically Temperley-Lieb diagrams NC_2 , which are quite often the most adapted, to our questions.

As a basic example for what can be done here, regarding O_N^+ , we have:

THEOREM 3.27. *The irreducible representations of O_N^+ with $N \geq 2$ can be labelled by positive integers, r_k with $k \in \mathbb{N}$, the fusion rules for these representations are*

$$r_k \otimes r_l = r_{|k-l|} + r_{|k-l|+2} + \dots + r_{k+l}$$

and the dimensions are $\dim r_k = (q^{k+1} - q^{-k-1})/(q - q^{-1})$, with $q + q^{-1} = N$.

PROOF. The idea is to skilfully recycle the well-known proof for SU_2 . Our claim is that we can construct, by recurrence on $k \in \mathbb{N}$, a sequence r_0, r_1, r_2, \dots of irreducible, self-adjoint and distinct representations of O_N^+ , satisfying:

$$r_0 = 1 \quad , \quad r_1 = u \quad , \quad r_{k-1} \otimes r_1 = r_{k-2} + r_k$$

In order to do so, we can use the formula $r_{k-2} \otimes r_1 = r_{k-3} + r_{k-1}$ and Frobenius duality, and we conclude there exists a certain representation r_k such that:

$$r_{k-1} \otimes r_1 = r_{k-2} + r_k$$

As a first observation, r_k is self-adjoint, because its character is a certain polynomial with integer coefficients in χ , which is self-adjoint. In order to prove now that r_k is irreducible, and non-equivalent to r_0, \dots, r_{k-1} , let us split as before $u^{\otimes k}$, as follows:

$$u^{\otimes k} = c_k r_k + c_{k-2} r_{k-2} + c_{k-4} r_{k-4} + \dots$$

The point now is that we have the following equalities and inequalities:

$$C_k = \sum_i c_i^2 \leq \dim(\text{End}(u^{\otimes k})) \leq |NC_2(k, k)| = C_k$$

Indeed, the equality at left is clear as before, then comes a standard inequality, then an inequality coming from easiness, then a standard equality. Thus, we have equality, so r_k is irreducible, and non-equivalent to r_{k-2}, r_{k-4}, \dots . Moreover, r_k is not equivalent to r_{k-1}, r_{k-3}, \dots either, by using the same argument as for SU_2 , and the end of the proof is exactly as for SU_2 . As for dimensions, by recurrence we obtain, with $q + q^{-1} = N$:

$$\dim r_k = q^k + q^{k-2} + \dots + q^{-k+2} + q^{-k}$$

But this gives the dimension formula in the statement, and we are done. \square

It is possible to use similar methods for the other main examples of free quantum groups, and do many other things, in relation with the Temperley-Lieb algebra.

3d. Meander determinants

We discuss now, following Di Francesco [40] and others, the computation of the Gram determinants for the free quantum groups, which is a very interesting question, related to many things. But let us start with S_N and other classical groups. We will need:

DEFINITION 3.28. *The Möbius function of any lattice, and so of P , is given by*

$$\mu(\pi, \sigma) = \begin{cases} 1 & \text{if } \pi = \sigma \\ -\sum_{\pi \leq \tau < \sigma} \mu(\pi, \tau) & \text{if } \pi < \sigma \\ 0 & \text{if } \pi \not\leq \sigma \end{cases}$$

with the construction being performed by recurrence.

As an illustration here, for $P(2) = \{||, \square\}$, we have by definition:

$$\mu(||, ||) = \mu(\square, \square) = 1$$

Also, $|| < \square$, with no intermediate partition in between, so we obtain:

$$\mu(||, \square) = -\mu(||, ||) = -1$$

Finally, we have $\square \not\leq ||$, and so we have as well the following formula:

$$\mu(\square, ||) = 0$$

We will need the Möbius inversion formula, which can be formulated as follows:

THEOREM 3.29. *The inverse of the adjacency matrix of $P(k)$, given by*

$$A_k(\pi, \sigma) = \begin{cases} 1 & \text{if } \pi \leq \sigma \\ 0 & \text{if } \pi \not\leq \sigma \end{cases}$$

is the Möbius matrix of P , given by $M_k(\pi, \sigma) = \mu(\pi, \sigma)$.

PROOF. This is well-known, coming from the fact that A_k is upper triangular. Indeed, when inverting, we are led into the recurrence for μ , from Definition 3.28. \square

As an illustration, for $P(2)$ the formula $M_2 = A_2^{-1}$ appears as follows:

$$\begin{pmatrix} 1 & -1 \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix}^{-1}$$

Now back to our Gram matrix considerations, we have the following result:

PROPOSITION 3.30. *The Gram matrix of the vectors ξ_π with $\pi \in P(k)$,*

$$G_{\pi\sigma} = N^{|\pi \vee \sigma|}$$

decomposes as a product of upper/lower triangular matrices, $G_k = A_k L_k$, where

$$L_k(\pi, \sigma) = \begin{cases} N(N-1) \dots (N - |\pi| + 1) & \text{if } \sigma \leq \pi \\ 0 & \text{otherwise} \end{cases}$$

and where A_k is the adjacency matrix of $P(k)$.

PROOF. We have indeed the following computation:

$$\begin{aligned} G_k(\pi, \sigma) &= N^{|\pi \vee \sigma|} \\ &= \# \left\{ i_1, \dots, i_k \in \{1, \dots, N\} \mid \ker i \geq \pi \vee \sigma \right\} \\ &= \sum_{\tau \geq \pi \vee \sigma} \# \left\{ i_1, \dots, i_k \in \{1, \dots, N\} \mid \ker i = \tau \right\} \\ &= \sum_{\tau \geq \pi \vee \sigma} N(N-1) \dots (N - |\tau| + 1) \end{aligned}$$

According now to the definition of A_k, L_k , this formula reads:

$$\begin{aligned} G_k(\pi, \sigma) &= \sum_{\tau \geq \pi} L_k(\tau, \sigma) \\ &= \sum_{\tau} A_k(\pi, \tau) L_k(\tau, \sigma) \\ &= (A_k L_k)(\pi, \sigma) \end{aligned}$$

Thus, we are led to the formula in the statement. \square

As an illustration for the above result, at $k = 2$ we have $P(2) = \{|\cdot|, \square\}$, and the above decomposition $G_2 = A_2 L_2$ appears as follows:

$$\begin{pmatrix} N^2 & N \\ N & N \end{pmatrix} = \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} N^2 - N & 0 \\ N & N \end{pmatrix}$$

We are led in this way to the following formula, due to Lindstöm:

THEOREM 3.31. *The determinant of the Gram matrix G_k is given by*

$$\det(G_k) = \prod_{\pi \in P(k)} \frac{N!}{(N - |\pi|)!}$$

with the convention that in the case $N < k$ we obtain 0.

PROOF. If we order $P(k)$ as usual, with respect to the number of blocks, and then lexicographically, A_k is upper triangular, and L_k is lower triangular. Thus, we have:

$$\begin{aligned} \det(G_k) &= \det(A_k) \det(L_k) \\ &= \det(L_k) \\ &= \prod_{\pi} L_k(\pi, \pi) \\ &= \prod_{\pi} N(N-1) \dots (N - |\pi| + 1) \end{aligned}$$

Thus, we are led to the formula in the statement. \square

Let us discuss as well the case of the orthogonal group O_N . Here the combinatorics is that of the Young diagrams. We denote by $|\cdot|$ the number of boxes, and we use quantity f^λ , which gives the number of standard Young tableaux of shape λ . We have then:

THEOREM 3.32. *The determinant of the Gram matrix of O_N is given by*

$$\det(G_{kN}) = \prod_{|\lambda|=k/2} f_N(\lambda)^{f^{2\lambda}}$$

where the quantities on the right are $f_N(\lambda) = \prod_{(i,j) \in \lambda} (N + 2j - i - 1)$.

PROOF. For the group O_N the Gram matrix is diagonalizable, as follows:

$$G_{kN} = \sum_{|\lambda|=k/2} f_N(\lambda) P_{2\lambda}$$

Here $1 = \sum P_{2\lambda}$ is the standard partition of unity associated to the Young diagrams having $k/2$ boxes, and the coefficients $f_N(\lambda)$ are those in the statement. Now since we have $Tr(P_{2\lambda}) = f^{2\lambda}$, this gives the formula in the statement. \square

In order to deal now with O_N^+, S_N^+ , we will need the following fact:

PROPOSITION 3.33. *The Gram matrices of $NC_2(2k) \simeq NC(k)$ are related by*

$$G_{2k,n}(\pi, \sigma) = n^k (\Delta_{kn}^{-1} G_{k,n^2} \Delta_{kn}^{-1})(\pi', \sigma')$$

where $\pi \rightarrow \pi'$ is the shrinking operation, and Δ_{kn} is the diagonal of G_{kn} .

PROOF. In the context of the bijection from Proposition 3.26, we have:

$$|\pi \vee \sigma| = k + 2|\pi' \vee \sigma'| - |\pi'| - |\sigma'|$$

We therefore have the following formula, valid for any $n \in \mathbb{N}$:

$$n^{|\pi \vee \sigma|} = n^{k+2|\pi' \vee \sigma'| - |\pi'| - |\sigma'|}$$

Thus, we are led to the formula in the statement. \square

Now back to O_N^+, S_N^+ , let us begin with some examples. We first have:

PROPOSITION 3.34. *The first Gram matrices and determinants for O_N^+ are*

$$\det \begin{pmatrix} N^2 & N \\ N & N^2 \end{pmatrix} = N^2(N^2 - 1)$$

$$\det \begin{pmatrix} N^3 & N^2 & N^2 & N^2 & N \\ N^2 & N^3 & N & N & N^2 \\ N^2 & N & N^3 & N & N^2 \\ N^2 & N & N & N^3 & N^2 \\ N & N^2 & N^2 & N^2 & N^3 \end{pmatrix} = N^5(N^2 - 1)^4(N^2 - 2)$$

with the matrices being written by using the lexicographic order on $NC_2(2k)$.

PROOF. The formula at $k = 2$, where $NC_2(4) = \{\square\square, \sqcap\}$, is clear from definitions. At $k = 3$ however, things are tricky. The partitions here are as follows:

$$NC(3) = \{|||, \square|, \square, |\square, \square\square\}$$

The Gram matrix and its determinant are, according to Theorem 3.31:

$$\det \begin{pmatrix} N^3 & N^2 & N^2 & N^2 & N \\ N^2 & N^2 & N & N & N \\ N^2 & N & N^2 & N & N \\ N^2 & N & N & N^2 & N \\ N & N & N & N & N \end{pmatrix} = N^5(N - 1)^4(N - 2)$$

By using Proposition 3.33, the Gram determinant of $NC_2(6)$ is given by:

$$\begin{aligned} \det(G_{6N}) &= \frac{1}{N^2\sqrt{N}} \times N^{10}(N^2 - 1)^4(N^2 - 2) \times \frac{1}{N^2\sqrt{N}} \\ &= N^5(N^2 - 1)^4(N^2 - 2) \end{aligned}$$

Thus, we have obtained the formula in the statement. \square

In general, such tricks won't work, because $NC(k)$ is strictly smaller than $P(k)$ at $k \geq 4$. However, following Di Francesco [40], we have the following result:

THEOREM 3.35. *The determinant of the Gram matrix for O_N^+ is given by*

$$\det(G_{kN}) = \prod_{r=1}^{\lfloor k/2 \rfloor} P_r(N)^{d_{k/2,r}}$$

where P_r are the Chebycheff polynomials, given by

$$P_0 = 1 \quad , \quad P_1 = X \quad , \quad P_{r+1} = XP_r - P_{r-1}$$

and $d_{kr} = f_{kr} - f_{k,r+1}$, with f_{kr} being the following numbers, depending on $k, r \in \mathbb{Z}$,

$$f_{kr} = \binom{2k}{k-r} - \binom{2k}{k-r-1}$$

with the convention $f_{kr} = 0$ for $k \notin \mathbb{Z}$.

PROOF. This is something quite technical, obtained by using a decomposition as follows of the Gram matrix G_{kN} , with the matrix T_{kN} being lower triangular:

$$G_{kN} = T_{kN} T_{kN}^t$$

Thus, a bit as in the proof of the Lindstöm formula, we obtain the result, but the problem lies however in the construction of T_{kN} , which is non-trivial. See [40]. \square

With this in hand, we have as well a similar formula for S_N^+ , obtained from Theorem 3.35 via Proposition 3.33. For the other free quantum groups, the computations can be done as well. For more on all this, we refer to [40] and related papers.

CHAPTER 4

Free space

4a. Projective space

We discuss in this chapter several things that can be done, going beyond the sphere setting. First we will discuss free projective geometry, which is by definition compact, and so can be developed in full generality, without norm restrictions. Then, at the end of the chapter, we will go back to the affine setting, with some further results.

As a first topic that we would like to discuss, which historically speaking, was at the beginning of everything, we have the following remarkable isomorphism:

$$PO_N^+ = PU_N^+$$

In order to get started, let us first discuss the classical case, and more specifically the precise relation between the orthogonal group O_N , and the unitary group U_N . Contrary to the passage $\mathbb{R}^N \rightarrow \mathbb{C}^N$, or to the passage $S_{\mathbb{R}}^{N-1} \rightarrow S_{\mathbb{C}}^{N-1}$, which are both elementary, the passage $O_N \rightarrow U_N$ cannot be understood directly. In order to understand this passage we must pass through the corresponding Lie algebras, as follows:

THEOREM 4.1. *The passage $O_N \rightarrow U_N$ appears via Lie algebra complexification,*

$$O_N \rightarrow \mathfrak{o}_N \rightarrow \mathfrak{u}_n \rightarrow U_N$$

with the Lie algebra \mathfrak{u}_N being a complexification of the Lie algebra \mathfrak{o}_N .

PROOF. This is something rather philosophical, and advanced as well, that we will not really need here, the idea being as follows:

(1) The unitary and orthogonal groups U_N, O_N are both Lie groups, in the sense that they are smooth manifolds. The corresponding Lie algebras $\mathfrak{u}_N, \mathfrak{o}_N$, which are by definition the respective tangent spaces at 1, can be computed by differentiating the equations defining U_N, O_N , with the conclusion being as follows:

$$\begin{aligned}\mathfrak{u}_N &= \left\{ A \in M_N(\mathbb{C}) \mid A^* = -A \right\} \\ \mathfrak{o}_N &= \left\{ B \in M_N(\mathbb{R}) \mid B^t = -B \right\}\end{aligned}$$

(2) This was for the correspondences $U_N \rightarrow \mathfrak{u}_N$ and $O_N \rightarrow \mathfrak{o}_N$. In the other sense, the correspondences $\mathfrak{u}_N \rightarrow U_N$ and $\mathfrak{o}_N \rightarrow O_N$ appear by exponentiation, the result here

stating that, around 1, the unitary matrices can be written as $U = e^A$, with $A \in \mathfrak{u}_N$, and the orthogonal matrices can be written as $U = e^B$, with $B \in \mathfrak{o}_N$.

(3) In view of all this, in order to understand the passage $O_N \rightarrow U_N$ it is enough to understand the passage $\mathfrak{o}_N \rightarrow \mathfrak{u}_N$. But, in view of the above formulae for $\mathfrak{o}_N, \mathfrak{u}_N$, this is basically an elementary linear algebra problem. Indeed, let us pick an arbitrary matrix $A \in M_N(\mathbb{C})$, and write it as follows, with $B, C \in M_N(\mathbb{R})$:

$$A = B + iC$$

In terms of B, C , the equation $A^* = -A$ defining the Lie algebra \mathfrak{u}_N reads:

$$B^t = -B \quad , \quad C^t = C$$

(4) As a first observation, we must have $B \in \mathfrak{o}_N$. Regarding now C , let us decompose this matrix as follows, with D being its diagonal, and C' being the reminder:

$$C = D + C'$$

The matrix C' being symmetric with 0 on the diagonal, by switching all the signs below the main diagonal we obtain a certain matrix $C'_- \in \mathfrak{o}_N$. Thus, we have decomposed $A \in \mathfrak{u}_N$ as follows, with $B, C'_- \in \mathfrak{o}_N$, and with $D \in M_N(\mathbb{R})$ being diagonal:

$$A = B + iD + iC'_-$$

(5) As a conclusion now, we have shown that we have a direct sum decomposition of real linear spaces as follows, with $\Delta \subset M_N(\mathbb{R})$ being the diagonal matrices:

$$\mathfrak{u}_N \simeq \mathfrak{o}_N \oplus \Delta \oplus \mathfrak{o}_N$$

Thus, we can stop our study here, and say that we have reached the conclusion in the statement, namely that \mathfrak{u}_N appears as a “complexification” of \mathfrak{o}_N . \square

As before with many other things, that we will not really need in what follows, this was just an introduction to the subject. More can be found in any Lie group book. In the free case now, the situation is much simpler, and we have:

THEOREM 4.2. *The passage $O_N^+ \rightarrow U_N^+$ appears via free complexification,*

$$U_N^+ = \widetilde{O}_N^+$$

where the free complexification of a pair (G, u) is the pair $(\widetilde{G}, \widetilde{u})$ with

$$C(\widetilde{G}) = \langle zu_{ij} \rangle \subset C(\mathbb{T}) * C(G) \quad , \quad \widetilde{u} = zu$$

where $z \in C(\mathbb{T})$ is the standard generator, given by $x \rightarrow x$ for any $x \in \mathbb{T}$.

PROOF. We have embeddings as follows, with the first one coming by using the counit, and with the second one coming from the universality property of U_N^+ :

$$O_N^+ \subset \widetilde{O}_N^+ \subset U_N^+$$

We must prove that the embedding on the right is an isomorphism, and there are several ways of doing this, all instructive, as follows:

(1) If we denote by v, u the fundamental corepresentations of O_N^+, U_N^+ , we have:

$$\begin{aligned} \text{Fix}(v^{\otimes k}) &= \text{span} \left(\xi_\pi \mid \pi \in NC_2(k) \right) \\ \text{Fix}(u^{\otimes k}) &= \text{span} \left(\xi_\pi \mid \pi \in \mathcal{NC}_2(k) \right) \end{aligned}$$

Moreover, the above vectors ξ_π are known to be linearly independent at $N \geq 2$, and so the above results provide us with bases, and we obtain:

$$\dim(\text{Fix}(v^{\otimes k})) = |NC_2(k)| \quad , \quad \dim(\text{Fix}(u^{\otimes k})) = |\mathcal{NC}_2(k)|$$

Now since integrating the character of a corepresentation amounts in counting the fixed points, the above two formulae can be rewritten as follows:

$$\int_{O_N^+} \chi_v^k = |NC_2(k)| \quad , \quad \int_{U_N^+} \chi_u^k = |\mathcal{NC}_2(k)|$$

But this shows, via standard free probability theory, that χ_v must follow the Winger semicircle law γ_1 , and that χ_u must follow the Voiculescu circular law Γ_1 :

$$\chi_v \sim \gamma_1 \quad , \quad \chi_u \sim \Gamma_1$$

On the other hand, by [87], when freely multiplying a semicircular variable by a Haar unitary we obtain a circular variable. Thus, the main character of \widetilde{O}_N^+ is circular:

$$\chi_{zv} \sim \Gamma_1$$

Now by forgetting about circular variables and free probability, the conclusion is that the inclusion $\widetilde{O}_N^+ \subset U_N^+$ preserves the law of the main character:

$$\text{law}(\chi_{zv}) = \text{law}(u)$$

Thus by Peter-Weyl we obtain that the inclusion $\widetilde{O}_N^+ \subset U_N^+$ must be an isomorphism, modulo the usual equivalence relation for quantum groups.

(2) A version of the above proof, not using any prior free probability knowledge, makes use of the easiness property of O_N^+, U_N^+ only, namely:

$$\begin{aligned} \text{Hom}(v^{\otimes k}, v^{\otimes l}) &= \text{span} \left(\xi_\pi \mid \pi \in NC_2(k, l) \right) \\ \text{Hom}(u^{\otimes k}, u^{\otimes l}) &= \text{span} \left(\xi_\pi \mid \pi \in \mathcal{NC}_2(k, l) \right) \end{aligned}$$

Indeed, let us look at the following inclusions of quantum groups:

$$O_N^+ \subset \widetilde{O}_N^+ \subset U_N^+$$

At the level of the associated Hom spaces we obtain reverse inclusions, as follows:

$$\text{Hom}(v^{\otimes k}, v^{\otimes l}) \supset \text{Hom}((zv)^{\otimes k}, (zv)^{\otimes l}) \supset \text{Hom}(u^{\otimes k}, u^{\otimes l})$$

The spaces on the left and on the right are known from easiness, the result being that these spaces are as follows:

$$\text{span} \left(T_\pi \Big| \pi \in \mathcal{NC}_2(k, l) \right) \supset \text{span} \left(T_\pi \Big| \pi \in \mathcal{NC}_2(k, l) \right)$$

Regarding the spaces in the middle, these are obtained from those on the left by “coloring”, so we obtain the same spaces as those on the right. Thus, by Tannakian duality, our embedding $\widetilde{O}_N^+ \subset U_N^+$ is an isomorphism, modulo the usual equivalence relation. \square

As an interesting consequence of the above result, we have:

THEOREM 4.3. *We have an identification as follows,*

$$PO_N^+ = PU_N^+$$

modulo the usual equivalence relation for compact quantum groups.

PROOF. As before, we have several proofs for this result, as follows:

(1) This follows from Theorem 4.2, because we have:

$$PU_N^+ = P\widetilde{O}_N^+ = PO_N^+$$

(2) We can deduce this as well directly. With notations as before, we have:

$$\text{Hom}((v \otimes v)^k, (v \otimes v)^l) = \text{span} \left(T_\pi \Big| \pi \in \mathcal{NC}_2((\bullet \bullet)^k, (\bullet \bullet)^l) \right)$$

$$\text{Hom}((u \otimes \bar{u})^k, (u \otimes \bar{u})^l) = \text{span} \left(T_\pi \Big| \pi \in \mathcal{NC}_2((\bullet \bullet)^k, (\bullet \bullet)^l) \right)$$

The sets on the right being equal, we conclude that the inclusion $PO_N^+ \subset PU_N^+$ preserves the corresponding Tannakian categories, and so must be an isomorphism. \square

As a conclusion, the passage $O_N^+ \rightarrow U_N^+$ is something much simpler than the passage $O_N \rightarrow U_N$, with this ultimately coming from the fact that the combinatorics of O_N^+, U_N^+ is something much simpler than the combinatorics of O_N, U_N . In addition, all this leads as well to the interesting conclusion that the free projective geometry does not fall into real and complex, but is rather unique and “scalarless”. We will be back to this.

Let us discuss now the projective spaces. Our starting point is the following functional analytic description of the real and complex projective spaces $P_{\mathbb{R}}^{N-1}, P_{\mathbb{C}}^{N-1}$:

PROPOSITION 4.4. *We have presentation results as follows,*

$$\begin{aligned} C(P_{\mathbb{R}}^{N-1}) &= C_{comm}^* \left((p_{ij})_{i,j=1,\dots,N} \mid p = \bar{p} = p^t = p^2, Tr(p) = 1 \right) \\ C(P_{\mathbb{C}}^{N-1}) &= C_{comm}^* \left((p_{ij})_{i,j=1,\dots,N} \mid p = p^* = p^2, Tr(p) = 1 \right) \end{aligned}$$

for the algebras of continuous functions on the real and complex projective spaces.

PROOF. We use the fact that the projective spaces $P_{\mathbb{R}}^{N-1}, P_{\mathbb{C}}^{N-1}$ can be respectively identified with the spaces of rank one projections in $M_N(\mathbb{R}), M_N(\mathbb{C})$. With this picture in mind, it is clear that we have arrows \leftarrow . In order to construct now arrows \rightarrow , consider the universal algebras on the right, A_R, A_C . These algebras being both commutative, by the Gelfand theorem we can write, with X_R, X_C being certain compact spaces:

$$A_R = C(X_R) \quad , \quad A_C = C(X_C)$$

Now by using the coordinate functions p_{ij} , we conclude that X_R, X_C are certain spaces of rank one projections in $M_N(\mathbb{R}), M_N(\mathbb{C})$. In other words, we have embeddings:

$$X_R \subset P_{\mathbb{R}}^{N-1} \quad , \quad X_C \subset P_{\mathbb{C}}^{N-1}$$

By transposing we obtain arrows \rightarrow , as desired. \square

The above result suggests the following definition:

DEFINITION 4.5. *Associated to any $N \in \mathbb{N}$ is the following universal algebra,*

$$C(P_+^{N-1}) = C^* \left((p_{ij})_{i,j=1,\dots,N} \mid p = p^* = p^2, Tr(p) = 1 \right)$$

whose abstract spectrum is called “free projective space”.

Observe that, according to our presentation results for the real and complex projective spaces $P_{\mathbb{R}}^{N-1}$ and $P_{\mathbb{C}}^{N-1}$, we have embeddings of compact quantum spaces, as follows:

$$P_{\mathbb{R}}^{N-1} \subset P_{\mathbb{C}}^{N-1} \subset P_+^{N-1}$$

Our first goal will be that of explaining why, in analogy with the uniqueness of the quantum group $PO_N^+ = PU_N^+$, the free projective space P_+^{N-1} is unique, and scalarless.

Let us first discuss the relation with the spheres. Given a closed subset $X \subset S_{\mathbb{R},+}^{N-1}$, its projective version is by definition the quotient space $X \rightarrow PX$ determined by the fact that $C(PX) \subset C(X)$ is the subalgebra generated by the following variables:

$$p_{ij} = x_i x_j$$

In order to discuss the relation with the spheres, it is convenient to neglect the material regarding the complex and hybrid cases, the projective versions of such spheres bringing nothing new. Thus, we are left with the 3 real spheres, and we have:

THEOREM 4.6. *The projective versions of the 3 real spheres are as follows,*

$$\begin{array}{ccccc}
 S_{\mathbb{R}}^{N-1} & \longrightarrow & S_{\mathbb{R},*}^{N-1} & \longrightarrow & S_{\mathbb{R},+}^{N-1} \\
 \downarrow & & \downarrow & & \downarrow \\
 P_{\mathbb{R}}^{N-1} & \longrightarrow & P_{\mathbb{C}}^{N-1} & \longrightarrow & P_{+}^{N-1}
 \end{array}$$

modulo the standard equivalence relation for the quantum algebraic manifolds.

PROOF. The assertion at left is true by definition. For the assertion at right, we have to prove that the variables $p_{ij} = z_i z_j$ over the free sphere $S_{\mathbb{R},+}^{N-1}$ satisfy the defining relations for $C(P_{+}^{N-1})$, from Definition 4.5, namely:

$$p = p^* = p^2 \quad , \quad Tr(p) = 1$$

We first have the following computation:

$$(p^*)_{ij} = p_{ji}^* = (z_j z_i)^* = z_i z_j = p_{ij}$$

We have as well the following computation:

$$(p^2)_{ij} = \sum_k p_{ik} p_{kj} = \sum_k z_i z_k^2 z_j = z_i z_j = p_{ij}$$

Finally, we have as well the following computation:

$$Tr(p) = \sum_k p_{kk} = \sum_k z_k^2 = 1$$

Regarding now $PS_{\mathbb{R},*}^{N-1} = P_{\mathbb{C}}^{N-1}$, the inclusion “ \subset ” follows from $abcd = cbad = cbda$. In the other sense now, the point is that we have a matrix model, as follows:

$$\pi : C(S_{\mathbb{R},*}^{N-1}) \rightarrow M_2(C(S_{\mathbb{C}}^{N-1})) \quad , \quad x_i \rightarrow \begin{pmatrix} 0 & z_i \\ \bar{z}_i & 0 \end{pmatrix}$$

But this gives the missing inclusion “ \supset ”, and we are done. See [11]. \square

In addition to the above result, let us mention that, as already discussed above, passing to the complex case brings nothing new. This is because the projective version of the free complex sphere is equal to the free projective space constructed above:

$$PS_{\mathbb{C},+}^{N-1} = P_{+}^{N-1}$$

And the same goes for the “hybrid” spheres. For details on all this, we refer to [8].

Following [12], we can axiomatize our various projective spaces, as follows:

DEFINITION 4.7. A monomial projective space is a closed subset $P \subset P_+^{N-1}$ obtained via relations of type

$$p_{i_1 i_2} \cdots p_{i_{k-1} i_k} = p_{i_{\sigma(1)} i_{\sigma(2)}} \cdots p_{i_{\sigma(k-1)} i_{\sigma(k)}}, \quad \forall (i_1, \dots, i_k) \in \{1, \dots, N\}^k$$

with σ ranging over a certain subset of the infinite symmetric group

$$S_\infty = \bigcup_{k \in 2\mathbb{N}} S_k$$

which is stable under the operation $\sigma \rightarrow |\sigma|$.

Here the stability under the operation $\sigma \rightarrow |\sigma|$ means that if the above relation associated to σ holds, then the following relation, associated to $|\sigma|$, must hold as well:

$$p_{i_0 i_1} \cdots p_{i_k i_{k+1}} = p_{i_0 i_{\sigma(1)}} p_{i_{\sigma(2)} i_{\sigma(3)}} \cdots p_{i_{\sigma(k-2)} i_{\sigma(k-1)}} p_{i_{\sigma(k)} i_{k+1}}$$

As an illustration, the basic projective spaces are all monomial:

PROPOSITION 4.8. The 3 projective spaces are all monomial, with the permutations

producing respectively the spaces $P_{\mathbb{R}}^{N-1}$, $P_{\mathbb{C}}^{N-1}$, and with no relation needed for P_+^{N-1} .

PROOF. We must divide the algebra $C(P_+^{N-1})$ by the relations associated to the diagrams in the statement, as well as those associated to their shifted versions, given by:

(1) The basic crossing, and its shifted version, produce the following relations:

$$p_{ab} = p_{ba}$$

$$p_{ab} p_{cd} = p_{ac} p_{bd}$$

Now by using these relations several times, we obtain the following formula:

$$p_{ab} p_{cd} = p_{ac} p_{bd} = p_{ca} p_{db} = p_{cd} p_{ab}$$

Thus, the space produced by the basic crossing is classical, $P \subset P_{\mathbb{C}}^{N-1}$. By using one more time the relations $p_{ab} = p_{ba}$ we conclude that we have $P = P_{\mathbb{R}}^{N-1}$, as claimed.

(2) The fattened crossing, and its shifted version, produce the following relations:

$$p_{ab} p_{cd} = p_{cd} p_{ab}$$

$$p_{ab} p_{cd} p_{ef} = p_{ad} p_{eb} p_{cf}$$

The first relations tell us that the projective space must be classical, $P \subset P_{\mathbb{C}}^{N-1}$. Now observe that with $p_{ij} = z_i \bar{z}_j$, the second relations read:

$$z_a \bar{z}_b z_c \bar{z}_d z_e \bar{z}_f = z_a \bar{z}_d z_e \bar{z}_b z_c \bar{z}_f$$

Since these relations are automatic, we have $P = P_{\mathbb{C}}^{N-1}$, and we are done. \square

Following [12], we can now formulate our classification result, as follows:

THEOREM 4.9. *The basic projective spaces, namely*

$$P_{\mathbb{R}}^{N-1} \subset P_{\mathbb{C}}^{N-1} \subset P_+^{N-1}$$

are the only monomial ones.

PROOF. We follow the proof from the affine case. Let \mathcal{R}_σ be the collection of relations associated to a permutation $\sigma \in S_k$ with $k \in 2\mathbb{N}$, as in Definition 4.7. We fix a monomial projective space $P \subset P_+^{N-1}$, and we associate to it subsets $G_k \subset S_k$, as follows:

$$G_k = \begin{cases} \{\sigma \in S_k \mid \mathcal{R}_\sigma \text{ hold over } P\} & (k \text{ even}) \\ \{\sigma \in S_k \mid \mathcal{R}_{|\sigma} \text{ hold over } P\} & (k \text{ odd}) \end{cases}$$

As in the affine case, we obtain in this way a filtered group $G = (G_k)$, which is stable under removing outer strings, and under removing neighboring strings. Thus the computations from the affine case apply, and show that we have only 3 possible situations, corresponding to the 3 projective spaces in Proposition 4.8. See [12]. \square

Let us discuss now similar results for the projective quantum groups. Given a closed subgroup $G \subset O_N^+$, its projective version $G \rightarrow PG$ is by definition given by the fact that $C(PG) \subset C(G)$ is the subalgebra generated by the following variables:

$$w_{ij,ab} = u_{ia} u_{jb}$$

In the classical case we recover in this way the usual projective version:

$$PG = G / (G \cap \mathbb{Z}_2^N)$$

We have the following key result:

THEOREM 4.10. *The quantum group O_N^* is the unique intermediate easy quantum group $O_N \subset G \subset O_N^+$. Moreover, in the non-easy case, the following happen:*

- (1) *The group inclusion $\mathbb{T}O_N \subset U_N$ is maximal.*
- (2) *The group inclusion $PO_N \subset PU_N$ is maximal.*
- (3) *The quantum group inclusion $O_N \subset O_N^*$ is maximal.*

PROOF. The first assertion comes by classifying the categories of pairings, and then:

- (1) This can be obtained by using standard Lie group methods.
- (2) This follows from (1), by taking projective versions.
- (3) This follows from (2), via standard algebraic lifting results. \square

Our claim now is that, under suitable assumptions, PU_N is the only intermediate object $PO_N \subset G \subset PO_N^+$. In order to formulate a precise statement here, we will need:

DEFINITION 4.11. *A projective category of pairings is a collection of subsets*

$$NC_2(2k, 2l) \subset E(k, l) \subset P_2(2k, 2l)$$

stable under the usual categorical operations, and satisfying $\sigma \in E \implies |\sigma| \in E$.

As basic examples for this notion, we have the following projective categories of pairings, where P_2^* is the category of matching pairings:

$$NC_2 \subset P_2^* \subset P_2$$

This follows indeed from definitions. Now with the above notion in hand, we can formulate the following projective analogue of the notion of easiness:

DEFINITION 4.12. *An intermediate compact quantum group*

$$PO_N \subset H \subset PO_N^+$$

is called projectively easy when its Tannakian category

$$\text{span}(NC_2(2k, 2l)) \subset \text{Hom}(v^{\otimes k}, v^{\otimes l}) \subset \text{span}(P_2(2k, 2l))$$

comes via via the following formula, using the standard $\pi \rightarrow T_\pi$ construction,

$$\text{Hom}(v^{\otimes k}, v^{\otimes l}) = \text{span}(E(k, l))$$

for a certain projective category of pairings $E = (E(k, l))$.

Thus, we have a projective notion of easiness. Observe that, given an easy quantum group $O_N \subset G \subset O_N^+$, its projective version $PO_N \subset PG \subset PO_N^+$ is projectively easy in our sense. In particular the basic projective quantum groups $PO_N \subset PU_N \subset PO_N^+$ are all projectively easy in our sense, coming from the categories $NC_2 \subset P_2^* \subset P_2$.

We have in fact the following general result, from [12]:

THEOREM 4.13. *We have a bijective correspondence between the affine and projective categories of partitions, given by the operation*

$$G \rightarrow PG$$

at the level of the corresponding affine and projective easy quantum groups.

PROOF. The construction of correspondence $D \rightarrow E$ is clear, simply by setting:

$$E(k, l) = D(2k, 2l)$$

Indeed, due to the axioms in Definition 4.11, the conditions in Definition 4.12 are satisfied. Conversely, given $E = (E(k, l))$ as in Definition 4.12, we can set:

$$D(k, l) = \begin{cases} E(k, l) & (k, l \text{ even}) \\ \{\sigma : |\sigma| \in E(k+1, l+1)\} & (k, l \text{ odd}) \end{cases}$$

Our claim is that $D = (D(k, l))$ is a category of partitions. Indeed:

(1) The composition action is clear. Indeed, when looking at the numbers of legs involved, in the even case this is clear, and in the odd case, this follows from:

$$\begin{aligned} |\sigma, |\sigma' \in E &\implies |\frac{\sigma}{\tau} \in E \\ &\implies \frac{\sigma}{\tau} \in D \end{aligned}$$

(2) For the tensor product axiom, we have 4 cases to be investigated, depending on the parity of the number of legs of σ, τ , as follows:

– The even/even case is clear.

– The odd/even case follows from the following computation:

$$\begin{aligned} |\sigma, \tau \in E &\implies |\sigma\tau \in E \\ &\implies \sigma\tau \in D \end{aligned}$$

– Regarding now the even/odd case, this can be solved as follows:

$$\begin{aligned} \sigma, |\tau \in E &\implies |\sigma|, |\tau \in E \\ &\implies |\sigma||\tau \in E \\ &\implies |\sigma\tau \in E \\ &\implies \sigma\tau \in D \end{aligned}$$

– As for the remaining odd/odd case, here the computation is as follows:

$$\begin{aligned} |\sigma, |\tau \in E &\implies ||\sigma|, |\tau \in E \\ &\implies ||\sigma||\tau \in E \\ &\implies \sigma\tau \in E \\ &\implies \sigma\tau \in D \end{aligned}$$

(3) Finally, the conjugation axiom is clear from definitions. It is also clear that both compositions $D \rightarrow E \rightarrow D$ and $E \rightarrow D \rightarrow E$ are the identities, as claimed. As for the quantum group assertion, this is clear as well from definitions. \square

Now back to uniqueness issues, we have here the following result, also from [12]:

THEOREM 4.14. *We have the following results:*

- (1) O_N^* is the only intermediate easy quantum group $O_N \subset G \subset O_N^+$.
- (2) PU_N is the only intermediate projectively easy quantum group $PO_N \subset G \subset PO_N^+$.

PROOF. The idea here is as follows:

(1) The assertion regarding $O_N \subset O_N^* \subset O_N^+$ is from [14], and this is something that we already know, explained in chapter 3.

(2) The assertion regarding $PO_N \subset PU_N \subset PO_N^+$ follows from the classification result in (1), and from the duality in Theorem 4.13. \square

Summarizing, we have analogues of the various affine classification results, with the remark that everything becomes simpler in the projective setting.

Our next goal will be that of finding projective versions of the quantum isometry group results that we have in the affine setting. We use the following action formalism, which is quite similar to the affine action formalism introduced in chapter 2:

DEFINITION 4.15. *Consider a closed subgroup of the free orthogonal group, $G \subset O_N^+$, and a closed subset of the free real sphere, $X \subset S_{\mathbb{R},+}^{N-1}$.*

(1) *We write $G \curvearrowright X$ when we have a morphism of C^* -algebras, as follows:*

$$\Phi : C(X) \rightarrow C(X) \otimes C(G)$$

$$\Phi(z_i) = \sum_a z_a \otimes u_{ai}$$

(2) *We write $PG \curvearrowright PX$ when we have a morphism of C^* -algebras, as follows:*

$$\Phi : C(PX) \rightarrow C(PX) \otimes C(PG)$$

$$\Phi(z_i z_j) = \sum_a z_a z_b \otimes u_{ai} u_{bj}$$

Observe that the above morphisms Φ , if they exist, are automatically coaction maps. Observe also that an affine action $G \curvearrowright X$ produces a projective action $PG \curvearrowright PX$. Let us also mention that given an algebraic subset $X \subset S_{\mathbb{R},+}^{N-1}$, it is routine to prove that there exist indeed universal quantum groups $G \subset O_N^+$ acting as (1), and as in (2). We have the following result, from [11] and related papers, with respect to the above notions:

THEOREM 4.16. *The quantum isometry groups of basic spheres and projective spaces,*

$$\begin{array}{ccccc} S_{\mathbb{R}}^{N-1} & \longrightarrow & S_{\mathbb{R},*}^{N-1} & \longrightarrow & S_{\mathbb{R},+}^{N-1} \\ \downarrow & & \downarrow & & \downarrow \\ P_{\mathbb{R}}^{N-1} & \longrightarrow & P_{\mathbb{C}}^{N-1} & \longrightarrow & P_+^{N-1} \end{array}$$

are the following affine and projective quantum groups,

$$\begin{array}{ccccc} O_N & \longrightarrow & O_N^* & \longrightarrow & O_N^+ \\ \downarrow & & \downarrow & & \downarrow \\ PO_N & \longrightarrow & PU_N & \longrightarrow & PO_N^+ \end{array}$$

with respect to the affine and projective action notions introduced above.

PROOF. The fact that the 3 quantum groups on top act affinely on the corresponding 3 spheres is known since [11], and is elementary, explained before. By restriction, the 3 quantum groups on the bottom follow to act on the corresponding 3 projective spaces. We must prove now that all these actions are universal. At right there is nothing to prove, so we are left with studying the actions on $S_{\mathbb{R}}^{N-1}$, $S_{\mathbb{R},*}^{N-1}$ and on $P_{\mathbb{R}}^{N-1}$, $P_{\mathbb{C}}^{N-1}$.

$P_{\mathbb{R}}^{N-1}$. Consider the following projective coordinates:

$$p_{ij} = z_i z_j \quad , \quad w_{ij,ab} = u_{ai} u_{bj}$$

In terms of these projective coordinates, the coaction map is given by:

$$\Phi(p_{ij}) = \sum_{ab} p_{ab} \otimes w_{ij,ab}$$

Thus, we have the following formulae:

$$\begin{aligned} \Phi(p_{ij}) &= \sum_{a < b} p_{ab} \otimes (w_{ij,ab} + w_{ij,ba}) + \sum_a p_{aa} \otimes w_{ij,aa} \\ \Phi(p_{ji}) &= \sum_{a < b} p_{ab} \otimes (w_{ji,ab} + w_{ji,ba}) + \sum_a p_{aa} \otimes w_{ji,aa} \end{aligned}$$

By comparing these two formulae, and then by using the linear independence of the variables $p_{ab} = z_a z_b$ for $a \leq b$, we conclude that we must have:

$$w_{ij,ab} + w_{ij,ba} = w_{ji,ab} + w_{ji,ba}$$

Let us apply now the antipode to this formula. For this purpose, observe that:

$$\begin{aligned} S(w_{ij,ab}) &= S(u_{ai} u_{bj}) \\ &= S(u_{bj}) S(u_{ai}) \\ &= u_{jb} u_{ia} \\ &= w_{ba,ji} \end{aligned}$$

Thus by applying the antipode we obtain:

$$w_{ba,ji} + w_{ab,ji} = w_{ba,ij} + w_{ab,ij}$$

By relabelling, we obtain the following formula:

$$w_{ji,ba} + w_{ij,ba} = w_{ji,ab} + w_{ij,ab}$$

Now by comparing with the original relation, we obtain:

$$w_{ij,ab} = w_{ji,ba}$$

But, with $w_{ij,ab} = u_{ai} u_{bj}$, this formula reads:

$$u_{ai} u_{bj} = u_{bj} u_{ai}$$

Thus $G \subset O_N$, and it follows that we have $PG \subset PO_N$, as claimed.

$\underline{P_{\mathbb{C}}^{N-1}}$. Consider a coaction map, written as follows, with $p_{ab} = z_a \bar{z}_b$:

$$\Phi(p_{ij}) = \sum_{ab} p_{ab} \otimes u_{ai} u_{bj}$$

The idea here will be that of using the following formula:

$$p_{ab} p_{cd} = p_{ad} p_{cb}$$

We have the following formulae:

$$\begin{aligned} \Phi(p_{ij} p_{kl}) &= \sum_{abcd} p_{ab} p_{cd} \otimes u_{ai} u_{bj} u_{ck} u_{dl} \\ \Phi(p_{il} p_{kj}) &= \sum_{abcd} p_{ad} p_{cb} \otimes u_{ai} u_{dl} u_{ck} u_{bj} \end{aligned}$$

The terms at left being equal, and the last terms at right being equal too, we deduce that, with $[a, b, c] = abc - cba$, we must have the following formula:

$$\sum_{abcd} u_{ai} [u_{bj}, u_{ck}, u_{dl}] \otimes p_{ab} p_{cd} = 0$$

Now since the quantities $p_{ab} p_{cd} = z_a \bar{z}_b z_c \bar{z}_d$ at right depend only on the numbers $|\{a, c\}|, |\{b, d\}| \in \{1, 2\}$, and this dependence produces the only possible linear relations between the variables $p_{ab} p_{cd}$, we are led to $2 \times 2 = 4$ equations, as follows:

- (1) $u_{ai} [u_{bj}, u_{ak}, u_{bl}] = 0, \forall a, b.$
- (2) $u_{ai} [u_{bj}, u_{ak}, u_{dl}] + u_{ai} [u_{dj}, u_{ak}, u_{bl}] = 0, \forall a, \forall b \neq d.$
- (3) $u_{ai} [u_{bj}, u_{ck}, u_{bl}] + u_{ci} [u_{bj}, u_{ak}, u_{bl}] = 0, \forall a \neq c, \forall b.$
- (4) $u_{ai} [u_{bj}, u_{ck}, u_{dl}] + u_{ai} [u_{dj}, u_{ck}, u_{bl}] + u_{ci} [u_{bj}, u_{ak}, u_{dl}] + u_{ci} [u_{dj}, u_{ak}, u_{bl}] = 0, \forall a \neq c, b \neq d.$

We will need in fact only the first two formulae. Since (1) corresponds to (2) at $b = d$, we conclude that (1,2) are equivalent to (2), with no restriction on the indices. By multiplying now this formula to the left by u_{ai} , and then summing over i , we obtain:

$$[u_{bj}, u_{ak}, u_{dl}] + [u_{dj}, u_{ak}, u_{bl}] = 0$$

We use now the antipode/relabel trick from [11]. By applying the antipode we obtain:

$$[u_{ld}, u_{ka}, u_{jb}] + [u_{lb}, u_{ka}, u_{jd}] = 0$$

By relabelling we obtain the following formula:

$$[u_{dl}, u_{ak}, u_{bj}] + [u_{dj}, u_{ak}, u_{bl}] = 0$$

Now by comparing with the original relation, we obtain:

$$[u_{bj}, u_{ak}, u_{dl}] = [u_{dj}, u_{ak}, u_{bl}] = 0$$

Thus $G \subset O_N^*$, and it follows that we have $PG \subset PU_N$, as desired. \square

The above results can be probably improved. As an example, let us say that a closed subgroup $G \subset U_N^+$ acts projectively on PX when we have a coaction map as follows:

$$\Phi(z_i z_j) = \sum_{ab} z_a z_b \otimes u_{ai} u_{bj}^*$$

The above proof can be adapted, by putting $*$ signs where needed, and Theorem 4.16 still holds, in this setting. However, establishing general universality results, involving arbitrary subgroups $H \subset PO_N^+$, looks like a quite non-trivial question.

4b. Grassmannians

In order to develop free projective geometry, a first piece of work is that of developing a theory of free Grassmannians, free flag manifolds, and free Stiefel manifolds. To be more precise, the definition of the free Grassmannians is straightforward, as follows, and the definition of the free flag manifolds and free Stiefel manifolds is very similar:

$$C(Gr_{LN}^+) = C^* \left((p_{ij})_{i,j=1,\dots,N} \mid p = p^* = p^2, Tr(p) = L \right)$$

Most of the arguments from the affine case carry over in the projective setting. We will be back to this later, with more details, in Part II of the present book.

We would like to end this discussion with something refreshing, namely a preliminary study of the free analogue of $P_{\mathbb{R}}^2$. We recall that the projective space $P_{\mathbb{R}}^{N-1}$ is the space of lines in \mathbb{R}^N passing through the origin, the basic examples being as follows:

(1) At $N = 2$ each such a line, in \mathbb{R}^2 passing through the origin, corresponds to 2 opposite points on the unit circle $\mathbb{T} \subset \mathbb{R}^2$. Thus, $P_{\mathbb{R}}^1$ corresponds to the upper semicircle of \mathbb{T} , with the endpoints identified, and so we obtain a circle, $P_{\mathbb{R}}^1 = \mathbb{T}$.

(2) At $N = 3$ the situation is similar, with $P_{\mathbb{R}}^2$ corresponding to the upper hemisphere of the sphere $S_{\mathbb{R}}^2 \subset \mathbb{R}^3$, with the points on the equator identified via $x = -x$. Topologically speaking, we can deform if we want the upper hemisphere into a square, with the equator becoming the boundary of this square, and in this picture, the $x = -x$ identification corresponds to the “identify opposite edges, with opposite orientations” folding method for the square, leading to a space $P_{\mathbb{R}}^2$ which is obviously not embeddable into \mathbb{R}^3 .

In what follows we will be interested in the free analogue P_+^2 of this projective space $P_{\mathbb{R}}^2$. Our main motivation comes from the fact that, according to the work of Bhowmick-D’Andrea-Dabrowski [20], later on continued with Das [21], the quantum isometry group $PO_3^+ = PU_3^+$ of the free projective space P_+^2 acts on the quark part of the Standard Model spectral triple, in Chamseddine-Connes formulation [26], [27].

We recall that the free projective space is defined by the following formula:

$$C(P_+^{N-1}) = C^* \left((p_{ij})_{i,j=1,\dots,N} \mid p = p^* = p^2, \text{Tr}(p) = 1 \right)$$

Let us first discuss, as a warm-up, the 2D case. Here the above matrix of projective coordinates is as follows, with $a = a^*$, $b = b^*$, $a + b = 1$:

$$p = \begin{pmatrix} a & c \\ c^* & b \end{pmatrix}$$

We have the following computation:

$$p^2 = \begin{pmatrix} a & c \\ c^* & b \end{pmatrix} \begin{pmatrix} a & c \\ c^* & b \end{pmatrix} = \begin{pmatrix} a^2 + cc^* & ac + cb \\ c^*a + bc^* & c^*c + b^2 \end{pmatrix}$$

Thus, the equations to be satisfied are as follows:

$$a^2 + cc^* = a$$

$$b^2 + c^*c = b$$

$$ac + cb = c$$

$$c^*a + bc^* = c^*$$

The 4th equation is the conjugate of the 3rd equation, so we remove it. By using $a + b = 1$, the remaining equations can be written as:

$$cc^* = c^*c = ab$$

$$ac + ca = 0$$

We have several explicit models for this, using the spheres $S_{\mathbb{R},+}^1$ and $S_{\mathbb{C},+}^1$, as well as the first row spaces of O_2^+ and U_2^+ , which ultimately lead us to SU_2 and $\bar{S}U_2$. These models are known to be all equivalent under Haar, and the question is whether they are identical. Thus, we must do computations as above in all models, and compare. These are all interesting questions, whose precise answers are not known, so far.

In the 3D case now, that of projective space P_+^2 , that we are mainly interested in here, the matrix of coordinates is as follows, with r, s, t self-adjoint, $r + s + t = 1$:

$$p = \begin{pmatrix} r & a & b \\ a^* & s & c \\ b^* & c^* & t \end{pmatrix}$$

The square of this matrix is given by:

$$p^2 = \begin{pmatrix} r & a & b \\ a^* & s & c \\ b^* & c^* & t \end{pmatrix} \begin{pmatrix} r & a & b \\ a^* & s & c \\ b^* & c^* & t \end{pmatrix}$$

We obtain the following formula:

$$p^2 = \begin{pmatrix} r^2 + aa^* + bb^* & ra + as + bc^* & rb + ac + bt \\ a^*r + sa^* + cb^* & a^*a + s^2 + cc^* & a^*b + sc + ct \\ b^*r + c^*a^* + tb^* & b^*a + c^*s + tc^* & b^*b + c^*c + t^2 \end{pmatrix}$$

On the diagonal, the equations for $p^2 = p$ are as follows:

$$aa^* + bb^* = r - r^2$$

$$a^*a + cc^* = s - s^2$$

$$b^*b + c^*c = t - t^2$$

On the off-diagonal upper part, the equations for $p^2 = p$ are as follows:

$$ra + as + bc^* = a$$

$$rb + ac + bt = b$$

$$a^*b + sc + ct = c$$

On the off-diagonal lower part, the equations for $p^2 = p$ are those above, conjugated. Thus, we have 6 equations. The first problem is that of using $r + s + t = 1$, in order to make these equations look better. Again, many interesting questions here.

4c. Lifting questions

There are many interesting lifting questions, between affine and projective geometry, with all sorts of half-liberations involved when lifting, and also within affine geometry itself, in connection with the free analogue of the stereographic projection.

So, what is \mathbb{R}_+^N ? There are several approaches to this problem, and in each case we are looking for a triple (A, Δ, h) consisting of an operator algebra A , typically a non-unital C^* -algebra, then a comultiplication Δ , understood to come accompanied by maps ε, S too, and then a Haar integration functional h . As a starting point, we have:

1. Products. Using $\mathbb{R}^N = (\mathbb{R})^N$. At the algebra level we have $C_0(\mathbb{R}^N) = C_0(\mathbb{R})^{\otimes N}$, and this suggests setting $C_0(\mathbb{R}_+^N) = C_0(\mathbb{R})^{*N}$. Thus we have a well-defined algebra A , and we have a comultiplication Δ too. The problem is with the Haar integration h . Our belief is that this problem can be solved by using suitable $N \times N$ matrix models, with our algebra A appearing on the diagonal. This looks quite tricky.

2. Polar coordinates. Using $[0, \infty) \times S_{\mathbb{R}}^{N-1} \rightarrow \mathbb{R}^N$. At the algebra level we have $C_0(\mathbb{R}^N) \subset C_0[0, \infty) \otimes C(S_{\mathbb{R}}^{N-1})$, and the very first question is that of understanding what the subalgebra $C_0(\mathbb{R}^N)$ exactly is. Since the quotient map $[0, \infty) \times S_{\mathbb{R}}^{N-1} \rightarrow \mathbb{R}^N$, given by $(r, x) \rightarrow rx$, has the property $0x = 0y$ for any x, y , this suggests that $C_0(\mathbb{R}^N) \subset C_0[0, \infty) \otimes C(S_{\mathbb{R}}^{N-1})$ consists of functions such that $f(0, x)$ does not depend on x . It is not very clear what this means, algebraically. Once this difficulty solved, we can probably

go ahead and construct something similar in the free case, $C_0(\mathbb{R}_+^N) \subset C_0[0, \infty) * C(S_{\mathbb{R},+}^{N-1})$, then look for a comultiplication Δ , and a Haar functional h .

2b. An alternative approach here would be by using $\mathbb{R}^N - \{0\} = (0, \infty) \times S_{\mathbb{R}}^{N-1}$. Here we have at the algebra level $C_0(\mathbb{R}^N - \{0\}) = C_0(0, \infty) \otimes C(S_{\mathbb{R}}^{N-1})$, so at least we have a clearly defined algebra, that we can generalize right away to the free setting, in the form of something of type $C_0(\mathbb{R}_+^N - \{0\}) = C_0(0, \infty) * C(S_{\mathbb{R},+}^{N-1})$. However, we cannot really investigate the Δ problem in this setting, so we run once again into a difficulty, namely constructing the correct lifts $C_0(\mathbb{R}^N)$ and $C_0(\mathbb{R}_+^N)$. This being said, the question of investigating the Haar functional h seems to make sense, even in this “ $-\{0\}$ ” setting, meaning without solving the lifting problem. This is actually quite unclear.

2c. Yet another alternative approach would be by using $P_{\mathbb{R}}^{N-1}$ instead of $S_{\mathbb{R}}^{N-1}$. The first question here is that of understanding the precise relation between the spaces $\mathbb{R} \times P_{\mathbb{R}}^{N-1}$ and \mathbb{R}^N , which is probably something well-known, but looks quite geometric and tricky. Assuming this geometric problem solved, we can probably have $C_0(\mathbb{R}^N)$ constructed afterwards in terms of $C_0(\mathbb{R}) \otimes C(P_{\mathbb{R}}^{N-1})$, and then at the free level, we can have $C_0(\mathbb{R}_+^N)$ constructed in terms of $C_0(\mathbb{R}) * C(P_{\mathbb{R},+}^{N-1})$, and then look for Δ , and for h .

2d. In fact, in modern terms, we are looking for a “free suspension of the free sphere”.

3. Compactification. Using $\mathbb{R}^N = S_{\mathbb{R}}^N - \{\infty\}$. To be more precise, we want to use the fact that $S_{\mathbb{R}}^N$ appears as the 1-point compactification of \mathbb{R}^N , with the isomorphism being the standard stereographic projection map. This might look like a weird idea, because it is not group-theoretical at all, the main feature of the stereographic projection being the fact that it is conformal, preserving angles, and so useful in geometry, but not in group theory. This being said, this is an idea to be explored too, especially since the formula for h should be not that complicated, and here are some preliminary computations:

Let us start with some abstract considerations. The 1-point compactification of \mathbb{R}^N is indeed the sphere $S_{\mathbb{R}}^N$, and for precise formulae and everything, to be given later, the best is to say that the 1-point compactification of $\mathbb{R}^N = \mathbb{R}^N \times \{0\} \subset \mathbb{R}^{N+1}$ is the unit sphere $S_{\mathbb{R}}^N \subset \mathbb{R}^{N+1}$, with the convention that the point which is added is $\infty = (1, 0, \dots, 0)$. Also, we make the convention that the coordinates on \mathbb{R}^{N+1} are denoted x_0, \dots, x_N .

In functional analysis terms, we have a diagram as follows, with all horizontal maps being inclusions, with the bar on $C_0(\mathbb{R}^N)$ standing for unitization, and with the 0 subscript

to $C(S_{\mathbb{R}}^N)$ standing for taking the ideal generated by the first coordinate x_0 :

$$\begin{array}{ccccc} C_0(\mathbb{R}^N) & \longrightarrow & \bar{C}_0(\mathbb{R}^N) & \longrightarrow & C_b(\mathbb{R}^N) \\ \parallel & & \parallel & & \\ C(S_{\mathbb{R}}^N)_0 & \longrightarrow & C(S_{\mathbb{R}}^N) & & \end{array}$$

In view of our motivations, this is not bad, because in the free case we can normally talk as well about the ideal $C(S_{\mathbb{R},+}^N)_0 \subset C(S_{\mathbb{R},+}^N)$ generated by the first coordinate x_0 . The problem is whether we can declare this ideal to be $C_0(\mathbb{R}_+^N)$, with a Δ and h .

In order to comment on this, let us do some computations, in the classical case. We first need the precise formulae of the isomorphism $\mathbb{R}^N \simeq S_{\mathbb{R}}^N - \{\infty\}$, obtained in practice by identifying $\mathbb{R}^N = \mathbb{R}^N \times \{0\} \subset \mathbb{R}^{N+1}$ with the unit sphere $S_{\mathbb{R}}^N \subset \mathbb{R}^{N+1}$, with the convention that the point which is added is $\infty = (1, 0, \dots, 0)$, via the stereographic projection. That is, we need the precise formulae of two inverse maps, as follows:

$$\Phi : \mathbb{R}^N \rightarrow S_{\mathbb{R}}^N - \{\infty\}$$

$$\Psi : S_{\mathbb{R}}^N - \{\infty\} \rightarrow \mathbb{R}^N$$

In one sense we must have $\Phi(v) = t(0, v) + (1-t)(1, 0)$, with $t \in (0, 1)$ being such that $\|\Phi(v)\| = 1$. The equation here is $(1-t)^2 + t^2\|v\|^2 = 1$, which simplifies to $t^2(1+\|v\|^2) = 2t$, with solution $t = \frac{2}{1+\|v\|^2}$, and so the formula of Φ is as follows:

$$\Phi(v) = (1, 0) + \frac{2}{1+\|v\|^2}(-1, v)$$

In the other sense we must have $(0, \Psi(c, x)) = \alpha(c, x) + (1-\alpha)(1, 0)$ for a certain $\alpha \in \mathbb{R}$, and from $\alpha c + 1 - \alpha = 0$ we get $\alpha = \frac{1}{1-c}$, so the formula of Ψ is as follows:

$$\Psi(c, x) = \frac{x}{1-c}$$

Here, as before, and in what follows too, we use $\mathbb{R}^{N+1} = \mathbb{R} \times \mathbb{R}^N$, with the coordinate of \mathbb{R} denoted x_0 , and with the coordinates of \mathbb{R}^N denoted x_1, \dots, x_N .

Let us discuss now the Δ problematics. We can transport the group structure of \mathbb{R}^N to a group structure on $S_{\mathbb{R}}^N - \{\infty\}$, as follows:

$$p \cdot q = \Phi(\Psi(p) + \Psi(q))$$

In view of the above formulae of Φ, Ψ , the multiplication on $S_{\mathbb{R}}^N - \{\infty\}$ that we obtain is given by the following formula:

$$\begin{aligned} (c, x) \cdot (d, y) &= \Phi(\Psi(c, x) + \Psi(d, y)) \\ &= \Phi\left(\frac{x}{1-c} + \frac{y}{1-d}\right) \\ &= (1, 0) + \frac{2}{1+t} \left(-1, \frac{x}{1-c} + \frac{y}{1-d}\right) \end{aligned}$$

Here the parameter t is given by the following formula:

$$t = \left\| \frac{x}{1-c} + \frac{y}{1-d} \right\|^2$$

Now by transposing, we obtain a comultiplication map as follows, with $C(S_{\mathbb{R}}^N)_0 \subset C(S_{\mathbb{R}}^N)$ being the ideal generated by the first coordinate x_0 :

$$\begin{aligned} \Delta : C(S_{\mathbb{R}}^N)_0 &\rightarrow C(S_{\mathbb{R}}^N)_0 \otimes C(S_{\mathbb{R}}^N)_0 \\ f &\rightarrow \left[(c, x), (d, y) \rightarrow f((c, x) \cdot (d, y)) \right] \end{aligned}$$

The problem is that of slowly working out the details of this map Δ , on various products of coordinates and so on, and see if we can get a decent formula for Δ out of this, and then if this formula has a free generalization or not.

Let us discuss now the Haar problematics, which is the point where we wanted to get, where things might get simpler. As before with Δ , we can transport the Haar integration over \mathbb{R}^N into an integration over $S_{\mathbb{R}}^N - \{\infty\}$, according to the following formula:

$$\int_{S_{\mathbb{R}}^N - \{\infty\}} f(x) = \int_{\mathbb{R}^N} f(\Phi(v)) dv$$

In practice, according to the above formula of Φ , the precise formula is:

$$\int_{S_{\mathbb{R}}^N - \{\infty\}} f(x) = \int_{\mathbb{R}^N} f\left((1, 0) + \frac{2}{1 + \|v\|^2} (-1, v)\right) dv$$

Passed the details of this formula, which might look quite complicated, the transport of the Haar integration over \mathbb{R}^N into an integration over $S_{\mathbb{R}}^N - \{\infty\}$ looks like something quite simple. Indeed, the measure on $S_{\mathbb{R}}^N - \{\infty\}$ should not be that far from the usual Haar measure of $S_{\mathbb{R}}^N$, with just a density added on the x_0 direction, and this because both measures, the transported one on $S_{\mathbb{R}}^N - \{\infty\}$, and the Haar one on $S_{\mathbb{R}}^N$, are invariant under the action of O_N , acting on the coordinates x_1, \dots, x_N .

In short, we should have a formula as follows, with on the right the integration being the usual Haar one on $S_{\mathbb{R}}^N$, and with $\varphi : [-1, 1] \rightarrow (0, \infty)$ being a certain density:

$$\int_{S_{\mathbb{R}}^N - \{\infty\}} f(x) = \int_{S_{\mathbb{R}}^N} f(x) \varphi(x_0) dx$$

Assuming all this understood, and φ explicitly computed, the extension to the free case would be probably quite routine, our conjecture being that the integration on \mathbb{R}_+^N , in a “free stereographic picture”, should be just a modification of the usual Weingarten formula for $S_{\mathbb{R},+}^N$, via a horizontal density $\psi : [-1, 1] \rightarrow (0, \infty)$, appearing as the free version of $\varphi : [-1, 1] \rightarrow (0, \infty)$, in the sense of the Bercovici-Pata bijection.

4d. Sums of squares

Another way of “escaping” from spheres, in the affine setting, is via various sums of squares, chosen to be more complicated than those defining the spheres. In order to discuss this, let us first study the compact hypersurfaces $X \subset \mathbb{R}_+^N$. These hypersurfaces fit into the C^* -algebra formalism, their definition being as follows:

DEFINITION 4.17. *A real compact hypersurface in N variables, denoted $X_f \subset \mathbb{R}_+^N$, is the abstract spectrum of a universal C^* -algebra of the following type,*

$$C(X_f) = C^* \left(x_1, \dots, x_N \mid x_i = x_i^*, f(x_1, \dots, x_N) = 0 \right)$$

with the noncommutative polynomial $f \in \mathbb{R} \langle x_1, \dots, x_N \rangle$ being such the maximal C^ -norm on the complex $*$ -algebra $\mathbb{C} \langle x_1, \dots, x_N \rangle / (f)$ is bounded.*

As a first result here, coming from the Gelfand theorem, we have:

THEOREM 4.18. *In order for X_f to exist, the real algebraic manifold*

$$X_f^\times = \left\{ x \in \mathbb{R}^N \mid f(x_1, \dots, x_N) = 0 \right\}$$

must be compact. In addition, in this case we have $\|x_i\|_\times \leq \|x_i\|$, for any i .

PROOF. Assuming that X_f exists, the Gelfand theorem shows that the algebra of continuous functions on the manifold X_f^\times in the statement appears as:

$$C(X_f^\times) = C(X_f) / \left\langle [x_i, x_j] = 0 \right\rangle$$

Thus we have an embedding of compact quantum spaces $X_f^\times \subset X_f$, and the norm estimate is clear as well, because such embeddings increase the norms. \square

Let us first discuss the quadratic case. We have here:

THEOREM 4.19. *Given a quadratic polynomial $f \in \mathbb{R} \langle x_1, \dots, x_N \rangle$, written as*

$$f = \sum_{ij} A_{ij} x_i x_j + \sum_i B_i x_i + C$$

the following conditions are equivalent:

- (1) X_f exists.
- (2) X_f^\times is compact.
- (3) The symmetric matrix $Q = \frac{A+A^t}{2}$ is positive or negative.

PROOF. The implication (1) \implies (2) being known from Theorem 4.18, and the implication (2) \iff (3) being well-known, we are left with proving (3) \implies (1). As a first remark here, by applying the adjoint, our manifold X_f is defined by:

$$\begin{cases} \sum_{ij} A_{ij} x_i x_j + \sum_i B_i x_i + C = 0 \\ \sum_{ij} A_{ij} x_j x_i + \sum_i B_i x_i + C = 0 \end{cases}$$

In terms of $P = \frac{A-A^t}{2}$ and $Q = \frac{A+A^t}{2}$, these equations can be written as:

$$\begin{cases} \sum_{ij} P_{ij} x_i x_j = 0 \\ \sum_{ij} Q_{ij} x_i x_j + \sum_i B_i x_i + C = 0 \end{cases}$$

Let us first examine the second equation. When regarding x as a column vector, and B as a row vector, this equation becomes an equality of 1×1 matrices, as follows:

$$x^t Q x + B x + C = 0$$

Now let us assume that Q is positive or negative. Up to a sign change, we can assume $Q > 0$. We can write $Q = U D U^t$, with $D = \text{diag}(d_i)$ and $d_i > 0$, and with $U \in O_N$. In terms of the vector $y = U^t x$, and with $E = B U$, our equation becomes:

$$y^t D y + E y + C = 0$$

By reverting back to sums and indices, this equation reads:

$$\sum_i d_i y_i^2 + \sum_i e_i y_i + C = 0$$

Now by making squares, this equation takes the following form:

$$\sum_i d_i \left(y_i + \frac{e_i}{2d_i} \right)^2 = c$$

By positivity, we deduce that we have the following estimate:

$$\left\| y_i + \frac{e_i}{2d_i} \right\|^2 \leq \frac{|c|}{d_i}$$

Thus our hypersurface X_f is well-defined, and we are done. \square

We have in fact the following result:

THEOREM 4.20. *Up to linear changes of coordinates, the free compact quadrics in \mathbb{R}_+^N are the empty set, the point, the standard free sphere $S_{\mathbb{R},+}^{N-1}$, defined by*

$$\sum_i x_i^2 = 1$$

and some intermediate spheres $S_{\mathbb{R}}^{N-1} \subset S \subset S_{\mathbb{R},+}^{N-1}$, which can be explicitly characterized. Moreover, for all these free quadrics, we have $\|x_i\| = \|x_i\|_\times$, for any i .

PROOF. We use the computations from the proof of Theorem 4.19. The first equation there, making appear the matrix $P = \frac{A-A^t}{2}$, is as follows:

$$\sum_{ij} P_{ij} x_i x_j = 0$$

As for the second equation, up to a linear change of the coordinates, this reads:

$$\sum_i z_i^2 = c$$

At $c < 0$ we obtain the empty set. At $c = 0$ we must have $z = 0$, and depending on whether the first equation is satisfied or not, we obtain either a point, or the empty set. At $c > 0$ now, we can assume by rescaling $c = 1$, and our second equation reads:

$$X_f \subset S_{\mathbb{R},+}^{N-1}$$

As a conclusion, the solutions here are certain subspaces $S \subset S_{\mathbb{R},+}^{N-1}$ which appear via equations of type $\sum_{ij} P_{ij} x_i x_j = 0$, with $P \in M_N(\mathbb{R})$ being antisymmetric, and with x_1, \dots, x_N appearing via z_1, \dots, z_N via a linear change of variables. Now observe that when redoing the above computation with X_f^\times at the place of X_f , we obtain $X_f = S_{\mathbb{R}}^{N-1}$, and this, because the equations $\sum_{ij} P_{ij} x_i x_j = 0$ are trivial for commuting variables. We conclude that our subspaces $S \subset S_{\mathbb{R},+}^{N-1}$ must satisfy:

$$S_{\mathbb{R}}^{N-1} \subset S \subset S_{\mathbb{R},+}^{N-1}$$

Thus, we are left with investigating which such subspaces can indeed be solutions. Observe that both the extreme cases can appear as solutions, as shown by:

$$\begin{aligned} X_{2x^2+y^2+\frac{3}{2}xy+\frac{1}{2}yx} &= S_{\mathbb{R}}^1 \\ X_{2x^2+y^2+xy+yx} &= S_{\mathbb{R},+}^1 \end{aligned}$$

Finally, the last assertion is clear for the empty set and for the point, and for the remaining hypersurfaces, this follows from $S_{\mathbb{R}}^{N-1} \subset S \subset S_{\mathbb{R},+}^{N-1}$. \square

Here is now yet another version of Theorem 4.19:

THEOREM 4.21. *Given M real linear functions L_1, \dots, L_M in N noncommuting variables x_1, \dots, x_N , the following are equivalent:*

- (1) $\sum_k L_k(x_1, \dots, x_N)^2 = 1$ defines a compact hypersurface in \mathbb{R}^N .
- (2) $\sum_k L_k(x_1, \dots, x_N)^2 = 1$ defines a compact quantum hypersurface.
- (3) The matrix formed by the coefficients of L_1, \dots, L_M has rank N .

PROOF. The equivalence (1) \iff (2) follows from the equivalence (1) \iff (2) in Theorem 4.19, because the surfaces under investigation are quadrics. As for the equivalence (2) \iff (3), this is well-known. More precisely, our equation read:

$$\begin{aligned} 1 &= \sum_k L_k(x_1, \dots, x_N)^2 \\ &= \sum_k \sum_i L_{ki} x_i \sum_j L_{kj} x_j \\ &= \sum_{ij} (L^t L)_{ij} x_i x_j \end{aligned}$$

Thus, in the context of Theorem 4.19, the underlying square matrix $A \in M_N(\mathbb{R})$ is given by $A = L^t L$. It follows that we have $Q = A = L^t L$, and so the condition $Q > 0$ is equivalent to $L^t L$ being invertible, and so to L to have rank N , as claimed. \square

In order to construct more examples, we will need the following basic fact:

PROPOSITION 4.22. *In a C^* -algebra we have*

$$\|x\|^p \leq 1 \implies \|x\| \leq 1$$

for any self-adjoint element x .

PROOF. With $n \in \mathbb{N}$ being such that $2^n \geq p$, we have:

$$\|x\|^{2^n} = \|x^2\|^{2^{n-1}} = \dots = \|x^{2^n}\| \leq \|x^p\| \cdot \|x^{2^n-p}\| \leq 1 \cdot \|x\|^{2^n-p}$$

Thus, we obtain $\|x\|^p \leq 1$, and so $\|x\| \leq 1$, as desired. \square

As an application, we have the following construction:

PROPOSITION 4.23. *Given integers $p_i \in \mathbb{N}$, the equation*

$$\sum_i x_i^{2p_i} = 1$$

defines a noncommutative hypersurface.

PROOF. This follows indeed from Proposition 4.22, by positivity. \square

More generally, we have the following result, covering our various examples, so far:

THEOREM 4.24. *Given M real linear functions L_1, \dots, L_M in N noncommuting variables x_1, \dots, x_N , and exponents $p_1, \dots, p_M \in \mathbb{N}$, the equation*

$$\sum_k L_k(x_1, \dots, x_N)^{2p_k} = 1$$

defines a quantum hypersurface, provided that the $M \times N$ matrix formed by the coefficients of L_1, \dots, L_M has rank N .

PROOF. By positivity, imposing the above equation leads to:

$$\|L_k(x_1, \dots, x_N)\| \leq 1, \quad \forall k$$

We are therefore left with the problem of uniformly bounding the norms $\|x_i\|$, and normally we can proceed here exactly as in the classical case. \square

More generally now, we have the following result:

THEOREM 4.25. *General construction of hypersurfaces, via equations of type*

$$\sum_k L_k L_k^* = 1$$

with $L_k \in \mathbb{R} \langle x_1, \dots, x_N \rangle$, improving the construction from Theorem 4.24.

PROOF. This does not look obvious at all. As usual, there are some norm estimates to be worked out too, in relation with the basic inequality $\|x_i\|_\times \leq \|x_i\|$. \square

Going beyond the above looks like a non-trivial question.

Part II

Free manifolds

*In the midnight hour
She cried more, more, more
With a rebel yell
She cried more, more, more*

CHAPTER 5

Free manifolds

5a. Quotient spaces

Let us begin with some generalities regarding the quotient spaces, and more general homogeneous spaces. Regarding the quotients, we have the following construction:

PROPOSITION 5.1. *Given a quantum subgroup $H \subset G$, with associated quotient map $\rho : C(G) \rightarrow C(H)$, if we define the quotient space $X = G/H$ by setting*

$$C(X) = \left\{ f \in C(G) \mid (\rho \otimes id)\Delta f = 1 \otimes f \right\}$$

then we have a coaction map as follows,

$$\Phi : C(X) \rightarrow C(X) \otimes C(G)$$

obtained as the restriction of the comultiplication of $C(G)$. In the classical case, we obtain in this way the usual quotient space $X = G/H$.

PROOF. Observe that the linear subspace $C(X) \subset C(G)$ defined in the statement is indeed a subalgebra, because it is defined via a relation of type $\varphi(f) = \psi(f)$, with both φ, ψ being morphisms of algebras. Observe also that in the classical case we obtain the algebra of continuous functions on the quotient space $X = G/H$, because:

$$\begin{aligned} (\rho \otimes id)\Delta f = 1 \otimes f &\iff (\rho \otimes id)\Delta f(h, g) = (1 \otimes f)(h, g), \forall h \in H, \forall g \in G \\ &\iff f(hg) = f(g), \forall h \in H, \forall g \in G \\ &\iff f(hg) = f(kg), \forall h, k \in H, \forall g \in G \end{aligned}$$

Regarding now the construction of Φ , observe that for $f \in C(X)$ we have:

$$\begin{aligned} (\rho \otimes id \otimes id)(\Delta \otimes id)\Delta f &= (\rho \otimes id \otimes id)(id \otimes \Delta)\Delta f \\ &= (id \otimes \Delta)(\rho \otimes id)\Delta f \\ &= (id \otimes \Delta)(1 \otimes f) \\ &= 1 \otimes \Delta f \end{aligned}$$

Thus the condition $f \in C(X)$ implies $\Delta f \in C(X) \otimes C(G)$, and this gives the existence of Φ . Finally, the other assertions are all clear. \square

As an illustration, in the group dual case we have:

PROPOSITION 5.2. *Assume that $G = \widehat{\Gamma}$ is a discrete group dual.*

- (1) *The quantum subgroups of G are $H = \widehat{\Lambda}$, with $\Gamma \rightarrow \Lambda$ being a quotient group.*
- (2) *For such a quantum subgroup $\widehat{\Lambda} \subset \widehat{\Gamma}$, we have $\widehat{\Gamma}/\widehat{\Lambda} = \widehat{\Theta}$, where:*

$$\Theta = \ker(\Gamma \rightarrow \Lambda)$$

PROOF. This is well-known, the idea being as follows:

(1) In one sense, this is clear. Conversely, since the algebra $C(G) = C^*(\Gamma)$ is cocommutative, so are all its quotients, and this gives the result.

(2) Consider a quotient map $r : \Gamma \rightarrow \Lambda$, and denote by $\rho : C^*(\Gamma) \rightarrow C^*(\Lambda)$ its extension. Consider a group algebra element, written as follows:

$$f = \sum_{g \in \Gamma} \lambda_g \cdot g \in C^*(\Gamma)$$

We have then the following computation:

$$\begin{aligned} f \in C(\widehat{\Gamma}/\widehat{\Lambda}) &\iff (\rho \otimes id)\Delta(f) = 1 \otimes f \\ &\iff \sum_{g \in \Gamma} \lambda_g \cdot r(g) \otimes g = \sum_{g \in \Gamma} \lambda_g \cdot 1 \otimes g \\ &\iff \lambda_g \cdot r(g) = \lambda_g \cdot 1, \forall g \in \Gamma \\ &\iff \text{supp}(f) \subset \ker(r) \end{aligned}$$

But this means that we have $\widehat{\Gamma}/\widehat{\Lambda} = \widehat{\Theta}$, with $\Theta = \ker(\Gamma \rightarrow \Lambda)$, as claimed. \square

Given two compact quantum spaces X, Y , we say that X is a quotient space of Y when we have an embedding of C^* -algebras $\alpha : C(X) \subset C(Y)$. We have:

DEFINITION 5.3. *We call a quotient space $G \rightarrow X$ homogeneous when*

$$\Delta(C(X)) \subset C(X) \otimes C(G)$$

where $\Delta : C(G) \rightarrow C(G) \otimes C(G)$ is the comultiplication map.

In other words, an homogeneous quotient space $G \rightarrow X$ is a quantum space coming from a subalgebra $C(X) \subset C(G)$, which is stable under the comultiplication. The relation with the quotient spaces from Proposition 5.1 is as follows:

THEOREM 5.4. *The following results hold:*

- (1) *The quotient spaces $X = G/H$ are homogeneous.*
- (2) *In the classical case, any homogeneous space is of type G/H .*
- (3) *In general, there are homogeneous spaces which are not of type G/H .*

PROOF. Once again these results are well-known, the proof being as follows:

(1) This is clear from Proposition 5.1.

(2) Consider a quotient map $p : G \rightarrow X$. The invariance condition in the statement tells us that we must have an action $G \curvearrowright X$, given by:

$$g(p(g')) = p(gg')$$

Thus, we have the following implication:

$$p(g') = p(g'') \implies p(gg') = p(gg''), \forall g \in G$$

Now observe that the following subset $H \subset G$ is a subgroup:

$$H = \left\{ g \in G \mid p(g) = p(1) \right\}$$

Indeed, $g, h \in H$ implies that we have:

$$p(gh) = p(g) = p(1)$$

Thus we have $gh \in H$, and the other axioms are satisfied as well. Our claim now is that we have an identification $X = G/H$, obtained as follows:

$$p(g) \rightarrow Hg$$

Indeed, the map $p(g) \rightarrow Hg$ is well-defined and bijective, because $p(g) = p(g')$ is equivalent to $p(g^{-1}g') = p(1)$, and so to $Hg = Hg'$, as desired.

(3) Given a discrete group Γ and an arbitrary subgroup $\Theta \subset \Gamma$, the quotient space $\widehat{\Gamma} \rightarrow \widehat{\Theta}$ is homogeneous. Now by using Proposition 5.2, we can see that if $\Theta \subset \Gamma$ is not normal, the quotient space $\widehat{\Gamma} \rightarrow \widehat{\Theta}$ is not of the form G/H . \square

With the above formalism in hand, let us try now to understand the general properties of the homogeneous spaces $G \rightarrow X$, in the sense of Theorem 5.4. We have:

PROPOSITION 5.5. *Assume that a quotient space $G \rightarrow X$ is homogeneous.*

(1) *We have a coaction map as follows, obtained as restriction of Δ :*

$$\Phi : C(X) \rightarrow C(X) \otimes C(G)$$

(2) *We have the following implication:*

$$\Phi(f) = f \otimes 1 \implies f \in \mathbb{C}1$$

(3) *We have as well the following formula:*

$$\left(id \otimes \int_G \right) \Phi f = \int_G f$$

(4) *The restriction of \int_G is the unique unital form satisfying:*

$$(\tau \otimes id)\Phi = \tau(\cdot)1$$

PROOF. These results are all elementary, the proof being as follows:

(1) This is clear from definitions, because Δ itself is a coaction.

(2) Assume that $f \in C(G)$ satisfies $\Delta(f) = f \otimes 1$. By applying the counit we obtain:

$$(\varepsilon \otimes id)\Delta f = (\varepsilon \otimes id)(f \otimes 1)$$

We conclude from this that we have $f = \varepsilon(f)1$, as desired.

(3) The formula in the statement, $(id \otimes \int_G)\Phi f = \int_G f$, follows indeed from the left invariance property of the Haar functional of $C(G)$, namely:

$$\left(id \otimes \int_G\right) \Delta f = \int_G f$$

(4) We use here the right invariance of the Haar functional of $C(G)$, namely:

$$\left(\int_G \otimes id\right) \Delta f = \int_G f$$

Indeed, we obtain from this that $tr = (\int_G)|_{C(X)}$ is G -invariant, in the sense that:

$$(tr \otimes id)\Phi f = tr(f)1$$

Conversely, assuming that $\tau : C(X) \rightarrow \mathbb{C}$ satisfies $(\tau \otimes id)\Phi f = \tau(f)1$, we have:

$$\begin{aligned} \left(\tau \otimes \int_G\right) \Phi(f) &= \int_G (\tau \otimes id)\Phi(f) \\ &= \int_G (\tau(f)1) \\ &= \tau(f) \end{aligned}$$

On the other hand, we can compute the same quantity as follows:

$$\begin{aligned} \left(\tau \otimes \int_G\right) \Phi(f) &= \tau \left(id \otimes \int_G\right) \Phi(f) \\ &= \tau(tr(f)1) \\ &= tr(f) \end{aligned}$$

Thus we have $\tau(f) = tr(f)$ for any $f \in C(X)$, and this finishes the proof. \square

Summarizing, we have a notion of noncommutative homogeneous space, which perfectly covers the classical case. In general, however, the group dual case shows that our formalism is more general than that of the quotient spaces G/H .

We discuss now an extra issue, of analytic nature. The point indeed is that for one of the most basic examples of actions, namely $O_N^+ \curvearrowright S_{\mathbb{R},+}^{N-1}$, the associated morphism $\alpha : C(X) \rightarrow C(G)$ is not injective. The same is true for other basic actions, in the free setting. In order to include such examples, we must relax our axioms:

DEFINITION 5.6. *An extended homogeneous space over a compact quantum group G consists of a morphism of C^* -algebras, and a coaction map, as follows,*

$$\alpha : C(X) \rightarrow C(G)$$

$$\Phi : C(X) \rightarrow C(X) \otimes C(G)$$

such that the following diagram commutes

$$\begin{array}{ccc} C(X) & \xrightarrow{\Phi} & C(X) \otimes C(G) \\ \alpha \downarrow & & \downarrow \alpha \otimes id \\ C(G) & \xrightarrow{\Delta} & C(G) \otimes C(G) \end{array}$$

and such that the following diagram commutes as well,

$$\begin{array}{ccc} C(X) & \xrightarrow{\Phi} & C(X) \otimes C(G) \\ \alpha \downarrow & & \downarrow id \otimes f \\ C(G) & \xrightarrow{f(\cdot)1} & C(X) \end{array}$$

where \int is the Haar integration over G . We write then $G \rightarrow X$.

As a first observation, when the morphism α is injective we obtain an homogeneous space in the previous sense. The examples with α not injective, which motivate the above formalism, include the standard action $O_N^+ \curvearrowright S_{\mathbb{R},+}^{N-1}$, and the standard action $U_N^+ \curvearrowright S_{\mathbb{C},+}^{N-1}$. Here are a few general remarks on the above axioms:

PROPOSITION 5.7. *Assume that we have morphisms of C^* -algebras*

$$\alpha : C(X) \rightarrow C(G)$$

$$\Phi : C(X) \rightarrow C(X) \otimes C(G)$$

satisfying the coassociativity condition $(\alpha \otimes id)\Phi = \Delta\alpha$.

- (1) *If α is injective on a dense $*$ -subalgebra $A \subset C(X)$, and $\Phi(A) \subset A \otimes C(G)$, then Φ is automatically a coaction map, and is unique.*
- (2) *The ergodicity type condition $(id \otimes \int)\Phi = \int \alpha(\cdot)1$ is equivalent to the existence of a linear form $\lambda : C(X) \rightarrow \mathbb{C}$ such that $(id \otimes \int)\Phi = \lambda(\cdot)1$.*

PROOF. This is something elementary, the idea being as follows:

(1) Assuming that we have a dense $*$ -subalgebra $A \subset C(X)$ as in the statement, satisfying $\Phi(A) \subset A \otimes C(G)$, the restriction $\Phi|_A$ is given by:

$$\Phi|_A = (\alpha|_A \otimes id)^{-1} \Delta \alpha|_A$$

This restriction and is therefore coassociative, and unique. By continuity, the morphism Φ itself follows to be coassociative and unique, as desired.

(2) Assuming $(id \otimes f)\Phi = \lambda(\cdot)1$, we have:

$$\left(\alpha \otimes \int\right) \Phi = \lambda(\cdot)1$$

On the other hand, we have as well the following formula:

$$\left(\alpha \otimes \int\right) \Phi = \left(id \otimes \int\right) \Delta\alpha = \int \alpha(\cdot)1$$

Thus we obtain $\lambda = \int \alpha$, as claimed. \square

Given an extended homogeneous space $G \rightarrow X$ in our sense, with associated map $\alpha : C(X) \rightarrow C(G)$, we can consider the image of this latter map:

$$\alpha : C(X) \rightarrow C(Y) \subset C(G)$$

Equivalently, at the level of the associated noncommutative spaces, we can factorize the corresponding quotient map $G \rightarrow Y \subset X$. With these conventions, we have:

PROPOSITION 5.8. *Consider an extended homogeneous space $G \rightarrow X$.*

- (1) $\Phi(f) = f \otimes 1 \implies f \in \mathbb{C}1$.
- (2) $tr = \int \alpha$ is the unique unital G -invariant form on $C(X)$.
- (3) The image space obtained by factorizing, $G \rightarrow Y$, is homogeneous.

PROOF. We have several assertions to be proved, the idea being as follows:

- (1) This follows indeed from $(id \otimes f)\Phi(f) = \int \alpha(f)1$, which gives $f = \int \alpha(f)1$.
- (2) The fact that $tr = \int \alpha$ is indeed G -invariant can be checked as follows:

$$\begin{aligned} (tr \otimes id)\Phi f &= (\int \alpha \otimes id)\Phi f \\ &= (\int \otimes id)\Delta\alpha f \\ &= \int \alpha(f)1 \\ &= tr(f)1 \end{aligned}$$

As for the uniqueness assertion, this follows as before.

(3) The condition $(\alpha \otimes id)\Phi = \Delta\alpha$, together with the fact that i is injective, allows us to factorize Δ into a morphism Ψ , as follows:

$$\begin{array}{ccc}
 C(X) & \xrightarrow{\Phi} & C(X) \otimes C(G) \\
 \alpha \downarrow & & \downarrow \alpha \otimes id \\
 C(Y) & \xrightarrow{\Psi} & C(Y) \otimes C(G) \\
 i \downarrow & & \downarrow i \otimes id \\
 C(G) & \xrightarrow{\Delta} & C(G) \otimes C(G)
 \end{array}$$

Thus the image space $G \rightarrow Y$ is indeed homogeneous, and we are done. \square

Finally, we have the following result:

THEOREM 5.9. *Let $G \rightarrow X$ be an extended homogeneous space, and construct quotients $X \rightarrow X'$, $G \rightarrow G'$ by performing the GNS construction with respect to $\int \alpha, \int$. Then α factorizes into an inclusion $\alpha' : C(X') \rightarrow C(G')$, and we have an homogeneous space.*

PROOF. We factorize $G \rightarrow Y \subset X$ as above. By performing the GNS construction with respect to $\int i\alpha, \int i, \int$, we obtain a diagram as follows:

$$\begin{array}{ccc}
 C(X) & \xrightarrow{p} & C(X') \\
 \alpha \downarrow & & \downarrow \alpha' \\
 C(Y) & \xrightarrow{q} & C(Y') \\
 i \downarrow & & \downarrow i' \\
 C(G) & \xrightarrow{r} & C(G')
 \end{array}
 \begin{array}{l}
 \nearrow^{tr'} \\
 \searrow_{f'} \\
 \mathbb{C}
 \end{array}$$

Indeed, with $tr = \int \alpha$, the GNS quotient maps p, q, r are defined respectively by:

$$\begin{aligned}
 \ker p &= \left\{ f \in C(X) \mid tr(f^*f) = 0 \right\} \\
 \ker q &= \left\{ f \in C(Y) \mid \int (f^*f) = 0 \right\} \\
 \ker r &= \left\{ f \in C(G) \mid \int (f^*f) = 0 \right\}
 \end{aligned}$$

Next, we can define factorizations i', α' as above. Observe that i' is injective, and that α' is surjective. Our claim now is that α' is injective as well. Indeed:

$$\begin{aligned} \alpha'p(f) = 0 &\implies q\alpha(f) = 0 \\ &\implies \int \alpha(f^*f) = 0 \\ &\implies \text{tr}(f^*f) = 0 \\ &\implies p(f) = 0 \end{aligned}$$

We conclude that we have $X' = Y'$, and this gives the result. \square

5b. Partial isometries

Our task now will be that of finding a suitable collection of “free homogeneous spaces”, generalizing at the same time the free spheres S , and the free unitary groups U . This can be done at several levels of generality, and central here is the construction of the free spaces of partial isometries, which can be done in fact for any easy quantum group. In order to explain this, let us start with the classical case. We have here:

DEFINITION 5.10. *Associated to any integers $L \leq M, N$ are the spaces*

$$\begin{aligned} O_{MN}^L &= \left\{ T : E \rightarrow F \text{ isometry} \mid E \subset \mathbb{R}^N, F \subset \mathbb{R}^M, \dim_{\mathbb{R}} E = L \right\} \\ U_{MN}^L &= \left\{ T : E \rightarrow F \text{ isometry} \mid E \subset \mathbb{C}^N, F \subset \mathbb{C}^M, \dim_{\mathbb{C}} E = L \right\} \end{aligned}$$

where the notion of isometry is with respect to the usual real/complex scalar products.

As a first observation, at $L = M = N$ we obtain the groups O_N, U_N :

$$O_{NN}^N = O_N \quad , \quad U_{NN}^N = U_N$$

Another interesting specialization is $L = M = 1$. Here the elements of O_{1N}^1 are the isometries $T : E \rightarrow \mathbb{R}$, with $E \subset \mathbb{R}^N$ one-dimensional. But such an isometry is uniquely determined by $T^{-1}(1) \in \mathbb{R}^N$, which must belong to $S_{\mathbb{R}}^{N-1}$. Thus, we have $O_{1N}^1 = S_{\mathbb{R}}^{N-1}$. Similarly, in the complex case we have $U_{1N}^1 = S_{\mathbb{C}}^{N-1}$, and so our results here are:

$$O_{1N}^1 = S_{\mathbb{R}}^{N-1} \quad , \quad U_{1N}^1 = S_{\mathbb{C}}^{N-1}$$

Yet another interesting specialization is $L = N = 1$. Here the elements of O_{1N}^1 are the isometries $T : \mathbb{R} \rightarrow F$, with $F \subset \mathbb{R}^M$ one-dimensional. But such an isometry is uniquely determined by $T(1) \in \mathbb{R}^M$, which must belong to $S_{\mathbb{R}}^{M-1}$. Thus, we have $O_{M1}^1 = S_{\mathbb{R}}^{M-1}$. Similarly, in the complex case we have $U_{M1}^1 = S_{\mathbb{C}}^{M-1}$, and so our results here are:

$$O_{M1}^1 = S_{\mathbb{R}}^{M-1} \quad , \quad U_{M1}^1 = S_{\mathbb{C}}^{M-1}$$

In general, the most convenient is to view the elements of O_{MN}^L, U_{MN}^L as rectangular matrices, and to use matrix calculus for their study. We have indeed:

PROPOSITION 5.11. *We have identifications of compact spaces*

$$O_{MN}^L \simeq \left\{ U \in M_{M \times N}(\mathbb{R}) \mid UU^t = \text{projection of trace } L \right\}$$

$$U_{MN}^L \simeq \left\{ U \in M_{M \times N}(\mathbb{C}) \mid UU^* = \text{projection of trace } L \right\}$$

with each partial isometry being identified with the corresponding rectangular matrix.

PROOF. We can indeed identify the partial isometries $T : E \rightarrow F$ with their corresponding extensions $U : \mathbb{R}^N \rightarrow \mathbb{R}^M$, $U : \mathbb{C}^N \rightarrow \mathbb{C}^M$, obtained by setting $U_{E^\perp} = 0$. Then, we can identify these latter maps U with the corresponding rectangular matrices. \square

As an illustration, at $L = M = N$ we recover in this way the usual matrix description of O_N, U_N . Also, at $L = M = 1$ we obtain the usual description of $S_{\mathbb{R}}^{N-1}, S_{\mathbb{C}}^{N-1}$, as row spaces over the corresponding groups O_N, U_N . Finally, at $L = N = 1$ we obtain the usual description of $S_{\mathbb{R}}^{N-1}, S_{\mathbb{C}}^{N-1}$, as column spaces over the corresponding groups O_N, U_N .

Now back to the general case, observe that the isometries $T : E \rightarrow F$, or rather their extensions $U : \mathbb{K}^N \rightarrow \mathbb{K}^M$, with $\mathbb{K} = \mathbb{R}, \mathbb{C}$, obtained by setting $U_{E^\perp} = 0$, can be composed with the isometries of $\mathbb{K}^M, \mathbb{K}^N$, according to the following scheme:

$$\begin{array}{ccccccc}
 \mathbb{K}^N & \xrightarrow{B^*} & \mathbb{K}^N & \xrightarrow{\dots\dots\dots U} & \mathbb{K}^M & \xrightarrow{A} & \mathbb{K}^M \\
 \uparrow & & \uparrow & & \uparrow & & \uparrow \\
 B(E) & \xrightarrow{\dots\dots\dots} & E & \xrightarrow{T} & F & \xrightarrow{\dots\dots\dots} & A(F)
 \end{array}$$

With the identifications in Proposition 5.11 made, the precise statement here is:

PROPOSITION 5.12. *We have action maps as follows, which are both transitive,*

$$O_M \times O_N \curvearrowright O_{MN}^L \quad , \quad (A, B)U = AUB^t$$

$$U_M \times U_N \curvearrowright U_{MN}^L \quad , \quad (A, B)U = AUB^*$$

whose stabilizers are respectively $O_L \times O_{M-L} \times O_{N-L}$ and $U_L \times U_{M-L} \times U_{N-L}$.

PROOF. We have indeed action maps as in the statement, which are transitive. Let us compute now the stabilizer G of the following point:

$$U = \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}$$

Since $(A, B) \in G$ satisfy $AU = UB$, their components must be of the following form:

$$A = \begin{pmatrix} x & * \\ 0 & a \end{pmatrix} \quad , \quad B = \begin{pmatrix} x & 0 \\ * & b \end{pmatrix}$$

Now since A, B are unitaries, these matrices follow to be block-diagonal, and so:

$$G = \left\{ (A, B) \mid A = \begin{pmatrix} x & 0 \\ 0 & a \end{pmatrix}, B = \begin{pmatrix} x & 0 \\ 0 & b \end{pmatrix} \right\}$$

The stabilizer of U is parametrized by triples (x, a, b) belonging to $O_L \times O_{M-L} \times O_{N-L}$ and $U_L \times U_{M-L} \times U_{N-L}$, and we are led to the conclusion in the statement. \square

Finally, let us work out the quotient space description of O_{MN}^L, U_{MN}^L . We have here:

THEOREM 5.13. *We have isomorphisms of homogeneous spaces as follows,*

$$\begin{aligned} O_{MN}^L &= (O_M \times O_N) / (O_L \times O_{M-L} \times O_{N-L}) \\ U_{MN}^L &= (U_M \times U_N) / (U_L \times U_{M-L} \times U_{N-L}) \end{aligned}$$

with the quotient maps being given by $(A, B) \rightarrow AUB^*$, where $U = \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}$.

PROOF. This is just a reformulation of Proposition 5.12, by taking into account the fact that the fixed point used in the proof there was $U = \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}$. \square

Once again, the basic examples here come from the cases $L = M = N$ and $L = M = 1$. At $L = M = N$ the quotient spaces at right are respectively:

$$O_N \quad , \quad U_N$$

At $L = M = 1$ the quotient spaces at right are respectively:

$$O_N/O_{N-1} \quad , \quad U_N/U_{N-1}$$

In fact, in the general $L = M$ case we obtain the following spaces:

$$O_{MN}^M = O_N/O_{N-M} \quad , \quad U_{MN}^M = U_N/U_{N-M}$$

Similarly, the examples coming from the cases $L = M = N$ and $L = N = 1$ are particular cases of the general $L = N$ case, where we obtain the following spaces:

$$O_{MN}^N = O_N/O_{M-N} \quad , \quad U_{MN}^N = U_N/U_{M-N}$$

Summarizing, we have here some basic homogeneous spaces, unifying the spheres with the rotation groups. The point now is that we can liberate these spaces, as follows:

DEFINITION 5.14. *Associated to any integers $L \leq M, N$ are the algebras*

$$\begin{aligned} C(O_{MN}^{L+}) &= C^* \left((u_{ij})_{i=1, \dots, M, j=1, \dots, N} \mid u = \bar{u}, uu^t = \text{projection of trace } L \right) \\ C(U_{MN}^{L+}) &= C^* \left((u_{ij})_{i=1, \dots, M, j=1, \dots, N} \mid uu^*, \bar{u}u^t = \text{projections of trace } L \right) \end{aligned}$$

with the trace being by definition the sum of the diagonal entries.

Observe that the above universal algebras are indeed well-defined, as it was previously the case for the free spheres, and this due to the trace conditions, which read:

$$\sum_{ij} u_{ij} u_{ij}^* = \sum_{ij} u_{ij}^* u_{ij} = L$$

We have inclusions between the various spaces constructed so far, as follows:

$$\begin{array}{ccc} O_{MN}^{L+} & \longrightarrow & U_{MN}^{L+} \\ \uparrow & & \uparrow \\ O_{MN}^L & \longrightarrow & U_{MN}^L \end{array}$$

At the level of basic examples now, at $L = M = 1$ and at $L = N = 1$ we obtain the following diagrams, showing that our formalism covers indeed the free spheres:

$$\begin{array}{ccc} S_{\mathbb{R},+}^{N-1} & \longrightarrow & S_{\mathbb{C},+}^{N-1} \\ \uparrow & & \uparrow \\ S_{\mathbb{R}}^{N-1} & \longrightarrow & S_{\mathbb{C}}^{N-1} \end{array} \quad \begin{array}{ccc} S_{\mathbb{R},+}^{M-1} & \longrightarrow & S_{\mathbb{C},+}^{M-1} \\ \uparrow & & \uparrow \\ S_{\mathbb{R}}^{M-1} & \longrightarrow & S_{\mathbb{C}}^{M-1} \end{array}$$

We have as well the following result, in relation with the free rotation groups:

PROPOSITION 5.15. *At $L = M = N$ we obtain the diagram*

$$\begin{array}{ccc} O_N^+ & \longrightarrow & U_N^+ \\ \uparrow & & \uparrow \\ O_N & \longrightarrow & U_N \end{array}$$

consisting of the groups O_N, U_N , and their liberations.

PROOF. We recall that the various quantum groups in the statement are constructed as follows, with the symbol \times standing once again for “commutative” and “free”:

$$\begin{aligned} C(O_N^\times) &= C_\times^* \left((u_{ij})_{i,j=1,\dots,N} \mid u = \bar{u}, uu^t = u^t u = 1 \right) \\ C(U_N^\times) &= C_\times^* \left((u_{ij})_{i,j=1,\dots,N} \mid uu^* = u^* u = 1, \bar{u}u^t = u^t \bar{u} = 1 \right) \end{aligned}$$

On the other hand, according to Proposition 5.11 and to Definition 5.14, we have the following presentation results:

$$\begin{aligned} C(O_{NN}^{N \times}) &= C_{\times}^* \left((u_{ij})_{i,j=1,\dots,N} \middle| u = \bar{u}, uu^t = \text{projection of trace } N \right) \\ C(U_{NN}^{N \times}) &= C_{\times}^* \left((u_{ij})_{i,j=1,\dots,N} \middle| uu^*, \bar{u}u^t = \text{projections of trace } N \right) \end{aligned}$$

We use now the standard fact that if $p = aa^*$ is a projection then $q = a^*a$ is a projection too. We use as well the following formulae:

$$\text{Tr}(uu^*) = \text{Tr}(u^t\bar{u}) \quad , \quad \text{Tr}(\bar{u}u^t) = \text{Tr}(u^*u)$$

We therefore obtain the following formulae:

$$\begin{aligned} C(O_{NN}^{N \times}) &= C_{\times}^* \left((u_{ij})_{i,j=1,\dots,N} \middle| u = \bar{u}, uu^t, u^t u = \text{projections of trace } N \right) \\ C(U_{NN}^{N \times}) &= C_{\times}^* \left((u_{ij})_{i,j=1,\dots,N} \middle| uu^*, u^*u, \bar{u}u^t, u^t\bar{u} = \text{projections of trace } N \right) \end{aligned}$$

Now observe that, in tensor product notation, the conditions at right are all of the form $(tr \otimes id)p = 1$. Thus, p must be follows, for the above conditions:

$$p = uu^*, u^*u, \bar{u}u^t, u^t\bar{u}$$

We therefore obtain that, for any faithful state φ , we have $(tr \otimes \varphi)(1 - p) = 0$. It follows from this that the following projections must be all equal to the identity:

$$p = uu^*, u^*u, \bar{u}u^t, u^t\bar{u}$$

But this leads to the conclusion in the statement. \square

Regarding now the homogeneous space structure of $O_{MN}^{L \times}, U_{MN}^{L \times}$, the situation here is a bit more complicated in the free case than in the classical case, due to a number of algebraic and analytic issues. We first have the following result:

PROPOSITION 5.16. *The spaces $U_{MN}^{L \times}$ have the following properties:*

- (1) *We have an action $U_M^{\times} \times U_N^{\times} \curvearrowright U_{MN}^{L \times}$, given by $u_{ij} \rightarrow \sum_{kl} u_{kl} \otimes a_{ki} \otimes b_{lj}^*$.*
- (2) *We have a map $U_M^{\times} \times U_N^{\times} \rightarrow U_{MN}^{L \times}$, given by $u_{ij} \rightarrow \sum_{r \leq L} a_{ri} \otimes b_{rj}^*$.*

Similar results hold for the spaces $O_{MN}^{L \times}$, with all the $$ exponents removed.*

PROOF. In the classical case, consider the following action and quotient maps:

$$U_M \times U_N \curvearrowright U_{MN}^L \quad , \quad U_M \times U_N \rightarrow U_{MN}^L$$

The transposes of these two maps are as follows, where $J = \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}$:

$$\begin{aligned} \varphi &\rightarrow ((U, A, B) \rightarrow \varphi(AUB^*)) \\ \varphi &\rightarrow ((A, B) \rightarrow \varphi(AJB^*)) \end{aligned}$$

But with $\varphi = u_{ij}$ we obtain precisely the formulae in the statement. The proof in the orthogonal case is similar. Regarding now the free case, the proof goes as follows:

(1) Assuming $uu^*u = u$, let us set:

$$U_{ij} = \sum_{kl} u_{kl} \otimes a_{ki} \otimes b_{lj}^*$$

We have then the following computation:

$$\begin{aligned} (UU^*U)_{ij} &= \sum_{pq} \sum_{klmst} u_{kl} u_{mn}^* u_{st} \otimes a_{ki} a_{mq}^* a_{sq} \otimes b_{lp}^* b_{np} b_{tj}^* \\ &= \sum_{klmt} u_{kl} u_{ml}^* u_{mt} \otimes a_{ki} \otimes b_{tj}^* \\ &= \sum_{kt} u_{kt} \otimes a_{ki} \otimes b_{tj}^* \\ &= U_{ij} \end{aligned}$$

Also, assuming that we have $\sum_{ij} u_{ij} u_{ij}^* = L$, we obtain:

$$\begin{aligned} \sum_{ij} U_{ij} U_{ij}^* &= \sum_{ij} \sum_{klst} u_{kl} u_{st}^* \otimes a_{ki} a_{si}^* \otimes b_{lj}^* b_{tj} \\ &= \sum_{kl} u_{kl} u_{kl}^* \otimes 1 \otimes 1 \\ &= L \end{aligned}$$

(2) Assuming $uu^*u = u$, let us set:

$$V_{ij} = \sum_{r \leq L} a_{ri} \otimes b_{rj}^*$$

We have then the following computation:

$$\begin{aligned} (VV^*V)_{ij} &= \sum_{pq} \sum_{x,y,z \leq L} a_{xi} a_{yq}^* a_{zq} \otimes b_{xp}^* b_{yp} b_{zj}^* \\ &= \sum_{x \leq L} a_{xi} \otimes b_{xj}^* \\ &= V_{ij} \end{aligned}$$

Also, assuming that we have $\sum_{ij} u_{ij} u_{ij}^* = L$, we obtain:

$$\begin{aligned} \sum_{ij} V_{ij} V_{ij}^* &= \sum_{ij} \sum_{r,s \leq L} a_{ri} a_{si}^* \otimes b_{rj}^* b_{sj} \\ &= \sum_{l \leq L} 1 \\ &= L \end{aligned}$$

By removing all the $*$ exponents, we obtain as well the orthogonal results. \square

Let us examine now the relation between the above maps. In the classical case, given a quotient space $X = G/H$, the associated action and quotient maps are given by:

$$\begin{cases} a : X \times G \rightarrow X & : (Hg, h) \rightarrow Hgh \\ p : G \rightarrow X & : g \rightarrow Hg \end{cases}$$

Thus we have $a(p(g), h) = p(gh)$. In our context, a similar result holds:

THEOREM 5.17. *With $G = G_M \times G_N$ and $X = G_{MN}^L$, where $G_N = O_N^\times, U_N^\times$, we have*

$$\begin{array}{ccc} G \times G & \xrightarrow{m} & G \\ p \times id \downarrow & & \downarrow p \\ X \times G & \xrightarrow{a} & X \end{array}$$

where a, p are the action map and the map constructed in Proposition 5.16.

PROOF. At the level of the associated algebras of functions, we must prove that the following diagram commutes, where Φ, α are morphisms of algebras induced by a, p :

$$\begin{array}{ccc} C(X) & \xrightarrow{\Phi} & C(X \times G) \\ \alpha \downarrow & & \downarrow \alpha \otimes id \\ C(G) & \xrightarrow{\Delta} & C(G \times G) \end{array}$$

When going right, and then down, the composition is as follows:

$$\begin{aligned} (\alpha \otimes id)\Phi(u_{ij}) &= (\alpha \otimes id) \sum_{kl} u_{kl} \otimes a_{ki} \otimes b_{lj}^* \\ &= \sum_{kl} \sum_{r \leq L} a_{rk} \otimes b_{rl}^* \otimes a_{ki} \otimes b_{lj}^* \end{aligned}$$

On the other hand, when going down, and then right, the composition is as follows, where F_{23} is the flip between the second and the third components:

$$\begin{aligned} \Delta\pi(u_{ij}) &= F_{23}(\Delta \otimes \Delta) \sum_{r \leq L} a_{ri} \otimes b_{rj}^* \\ &= F_{23} \left(\sum_{r \leq L} \sum_{kl} a_{rk} \otimes a_{ki} \otimes b_{rl}^* \otimes b_{lj}^* \right) \end{aligned}$$

Thus the above diagram commutes indeed, and this gives the result. \square

5c. Partial permutations

Let us discuss now some discrete extensions of the above constructions. We have:

DEFINITION 5.18. *Associated to a partial permutation, $\sigma : I \simeq J$ with $I \subset \{1, \dots, N\}$ and $J \subset \{1, \dots, M\}$, is the real/complex partial isometry*

$$T_\sigma : \text{span} \left(e_i \mid i \in I \right) \rightarrow \text{span} \left(e_j \mid j \in J \right)$$

given on the standard basis elements by $T_\sigma(e_i) = e_{\sigma(i)}$.

Let S_{MN}^L be the set of partial permutations $\sigma : I \simeq J$ as above, with range $I \subset \{1, \dots, N\}$ and target $J \subset \{1, \dots, M\}$, and with $L = |I| = |J|$. We have:

PROPOSITION 5.19. *The space of partial permutations signed by elements of \mathbb{Z}_s ,*

$$H_{MN}^{sL} = \left\{ T(e_i) = w_i e_{\sigma(i)} \mid \sigma \in S_{MN}^L, w_i \in \mathbb{Z}_s \right\}$$

is isomorphic to the quotient space

$$(H_M^s \times H_N^s) / (H_L^s \times H_{M-L}^s \times H_{N-L}^s)$$

via a standard isomorphism.

PROOF. This follows by adapting the computations in the proof of Proposition 5.12 and Theorem 5.13. Indeed, we have an action map as follows, which is transitive:

$$H_M^s \times H_N^s \rightarrow H_{MN}^{sL} \quad , \quad (A, B)U = AUB^*$$

Consider now the following point:

$$U = \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}$$

The stabilizer of this point follows to be the following group:

$$H_L^s \times H_{M-L}^s \times H_{N-L}^s$$

To be more precise, this group is embedded via:

$$(x, a, b) \rightarrow \left[\begin{pmatrix} x & 0 \\ 0 & a \end{pmatrix}, \begin{pmatrix} x & 0 \\ 0 & b \end{pmatrix} \right]$$

But this gives the result. □

In the free case now, the idea is similar, by using inspiration from the construction of the quantum group $H_N^{s+} = \mathbb{Z}_s \wr_* S_N^+$. The result here is as follows:

PROPOSITION 5.20. *The compact quantum space H_{MN}^{sL+} associated to the algebra*

$$C(H_{MN}^{sL+}) = C(U_{MN}^{L+}) / \langle u_{ij} u_{ij}^* = u_{ij}^* u_{ij} = p_{ij} = \text{projections}, u_{ij}^s = p_{ij} \rangle$$

has an action map, and is the target of a quotient map, as in Theorem 5.17.

PROOF. We must show that if the variables u_{ij} satisfy the relations in the statement, then these relations are satisfied as well for the following variables:

$$U_{ij} = \sum_{kl} u_{kl} \otimes a_{ki} \otimes b_{lj}^* \quad , \quad V_{ij} = \sum_{r \leq L} a_{ri} \otimes b_{rj}^*$$

We use the fact that the standard coordinates a_{ij}, b_{ij} on the quantum groups H_M^{s+}, H_N^{s+} satisfy the following relations, for any $x \neq y$ on the same row or column of a, b :

$$xy = xy^* = 0$$

We obtain, by using these relations, the following formula:

$$U_{ij}U_{ij}^* = \sum_{klmn} u_{kl}u_{mn}^* \otimes a_{ki}a_{mi}^* \otimes b_{lj}^*b_{mj} = \sum_{kl} u_{kl}u_{kl}^* \otimes a_{ki}a_{ki}^* \otimes b_{lj}^*b_{lj}$$

On the other hand, we have as well the following formula:

$$V_{ij}V_{ij}^* = \sum_{r,t \leq L} a_{ri}a_{ti}^* \otimes b_{rj}^*b_{tj} = \sum_{r \leq L} a_{ri}a_{ri}^* \otimes b_{rj}^*b_{rj}$$

In terms of the projections $x_{ij} = a_{ij}a_{ij}^*$, $y_{ij} = b_{ij}b_{ij}^*$, $p_{ij} = u_{ij}u_{ij}^*$, we have:

$$U_{ij}U_{ij}^* = \sum_{kl} p_{kl} \otimes x_{ki} \otimes y_{lj} \quad , \quad V_{ij}V_{ij}^* = \sum_{r \leq L} x_{ri} \otimes y_{rj}$$

By repeating the computation, we conclude that these elements are projections. Also, a similar computation shows that $U_{ij}^*U_{ij}, V_{ij}^*V_{ij}$ are given by the same formulae. Finally, once again by using the relations of type $xy = xy^* = 0$, we have:

$$U_{ij}^s = \sum_{k_r l_r} u_{k_1 l_1} \dots u_{k_s l_s} \otimes a_{k_1 i} \dots a_{k_s i} \otimes b_{l_1 j}^* \dots b_{l_s j}^* = \sum_{kl} u_{kl}^s \otimes a_{ki}^s \otimes (b_{lj}^*)^s$$

On the other hand, we have as well the following formula:

$$V_{ij}^s = \sum_{r_1 \leq L} a_{r_1 i} \dots a_{r_s i} \otimes b_{r_1 j}^* \dots b_{r_s j}^* = \sum_{r \leq L} a_{ri}^s \otimes (b_{rj}^*)^s$$

Thus the conditions of type $u_{ij}^s = p_{ij}$ are satisfied as well, and we are done. \square

Let us discuss now the general case. We have the following result:

PROPOSITION 5.21. *The various spaces G_{MN}^L constructed so far appear by imposing to the standard coordinates of U_{MN}^{L+} the relations*

$$\sum_{i_1 \dots i_s} \sum_{j_1 \dots j_s} \delta_\pi(i) \delta_\sigma(j) u_{i_1 j_1}^{e_1} \dots u_{i_s j_s}^{e_s} = L^{|\pi \vee \sigma|}$$

with $s = (e_1, \dots, e_s)$ ranging over all the colored integers, and with $\pi, \sigma \in D(0, s)$.

PROOF. According to the various constructions above, the relations defining the quantum space G_{MN}^L can be written as follows, with σ ranging over a family of generators, with no upper legs, of the corresponding category of partitions D :

$$\sum_{j_1 \dots j_s} \delta_\sigma(j) u_{i_1 j_1}^{e_1} \dots u_{i_s j_s}^{e_s} = \delta_\sigma(i)$$

We therefore obtain the relations in the statement, as follows:

$$\begin{aligned} \sum_{i_1 \dots i_s} \sum_{j_1 \dots j_s} \delta_\pi(i) \delta_\sigma(j) u_{i_1 j_1}^{e_1} \dots u_{i_s j_s}^{e_s} &= \sum_{i_1 \dots i_s} \delta_\pi(i) \sum_{j_1 \dots j_s} \delta_\sigma(j) u_{i_1 j_1}^{e_1} \dots u_{i_s j_s}^{e_s} \\ &= \sum_{i_1 \dots i_s} \delta_\pi(i) \delta_\sigma(i) \\ &= L^{|\pi \vee \sigma|} \end{aligned}$$

As for the converse, this follows by using the relations in the statement, by keeping π fixed, and by making σ vary over all the partitions in the category. \square

In the general case now, where $G = (G_N)$ is an arbitrary uniform easy quantum group, we can construct spaces G_{MN}^L by using the above relations, and we have:

THEOREM 5.22. *The spaces $G_{MN}^L \subset U_{MN}^{L+}$ constructed by imposing the relations*

$$\sum_{i_1 \dots i_s} \sum_{j_1 \dots j_s} \delta_\pi(i) \delta_\sigma(j) u_{i_1 j_1}^{e_1} \dots u_{i_s j_s}^{e_s} = L^{|\pi \vee \sigma|}$$

with π, σ ranging over all the partitions in the associated category, having no upper legs, are subject to an action map/quotient map diagram, as in Theorem 5.17.

PROOF. We proceed as in the proof of Proposition 5.20. We must prove that, if the variables u_{ij} satisfy the relations in the statement, then so do the following variables:

$$U_{ij} = \sum_{kl} u_{kl} \otimes a_{ki} \otimes b_{lj}^* \quad , \quad V_{ij} = \sum_{r \leq L} a_{ri} \otimes b_{rj}^*$$

Regarding the variables U_{ij} , the computation here goes as follows:

$$\begin{aligned} &\sum_{i_1 \dots i_s} \sum_{j_1 \dots j_s} \delta_\pi(i) \delta_\sigma(j) U_{i_1 j_1}^{e_1} \dots U_{i_s j_s}^{e_s} \\ &= \sum_{i_1 \dots i_s} \sum_{j_1 \dots j_s} \sum_{k_1 \dots k_s} \sum_{l_1 \dots l_s} u_{k_1 l_1}^{e_1} \dots u_{k_s l_s}^{e_s} \otimes \delta_\pi(i) \delta_\sigma(j) a_{k_1 i_1}^{e_1} \dots a_{k_s i_s}^{e_s} \otimes (b_{l_s j_s}^{e_s} \dots b_{l_1 j_1}^{e_1})^* \\ &= \sum_{k_1 \dots k_s} \sum_{l_1 \dots l_s} \delta_\pi(k) \delta_\sigma(l) u_{k_1 l_1}^{e_1} \dots u_{k_s l_s}^{e_s} \\ &= L^{|\pi \vee \sigma|} \end{aligned}$$

For the variables V_{ij} the proof is similar, as follows:

$$\begin{aligned}
& \sum_{i_1 \dots i_s} \sum_{j_1 \dots j_s} \delta_\pi(i) \delta_\sigma(j) V_{i_1 j_1}^{e_1} \dots V_{i_s j_s}^{e_s} \\
&= \sum_{i_1 \dots i_s} \sum_{j_1 \dots j_s} \sum_{l_1, \dots, l_s \leq L} \delta_\pi(i) \delta_\sigma(j) a_{l_1 i_1}^{e_1} \dots a_{l_s i_s}^{e_s} \otimes (b_{l_s j_s}^{e_s} \dots b_{l_1 j_1}^{e_1})^* \\
&= \sum_{l_1, \dots, l_s \leq L} \delta_\pi(l) \delta_\sigma(l) \\
&= L^{|\pi \vee \sigma|}
\end{aligned}$$

Thus we have constructed an action map, and a quotient map, as in Proposition 5.20, and the commutation of the diagram in Theorem 5.17 is then trivial. \square

5d. Integration results

Let us discuss now the integration over the various noncommutative spaces constructed so far, and notably over the spaces G_{MN}^L , which are quite general. We first have:

DEFINITION 5.23. *The integration functional of G_{MN}^L is the composition*

$$\int_{G_{MN}^L} : C(G_{MN}^L) \rightarrow C(G_M \times G_N) \rightarrow \mathbb{C}$$

of the representation $u_{ij} \rightarrow \sum_{r \leq L} a_{ri} \otimes b_{rj}^*$ with the Haar functional of $G_M \times G_N$.

Observe that in the case $L = M = N$ we obtain the integration over G_N . Also, at $L = M = 1$, or at $L = N = 1$, we obtain the integration over the sphere.

In the general case now, we first have the following result:

PROPOSITION 5.24. *The integration functional of G_{MN}^L has the invariance property*

$$\left(\int_{G_{MN}^L} \otimes id \right) \Phi(x) = \int_{G_{MN}^L} x$$

with respect to the coaction map, namely:

$$\Phi(u_{ij}) = \sum_{kl} u_{kl} \otimes a_{ki} \otimes b_{lj}^*$$

PROOF. We restrict the attention to the orthogonal case, the proof in the unitary case being similar. We must check the following formula:

$$\left(\int_{G_{MN}^L} \otimes id \right) \Phi(u_{i_1 j_1} \dots u_{i_s j_s}) = \int_{G_{MN}^L} u_{i_1 j_1} \dots u_{i_s j_s}$$

Let us compute the left term. This is given by:

$$\begin{aligned}
X &= \left(\int_{G_{MN}^L} \otimes id \right) \sum_{k_x l_x} u_{k_1 l_1} \dots u_{k_s l_s} \otimes a_{k_1 i_1} \dots a_{k_s i_s} \otimes b_{l_1 j_1}^* \dots b_{l_s j_s}^* \\
&= \sum_{k_x l_x} \sum_{r_x \leq L} a_{k_1 i_1} \dots a_{k_s i_s} \otimes b_{l_1 j_1}^* \dots b_{l_s j_s}^* \int_{G_M} a_{r_1 k_1} \dots a_{r_s k_s} \int_{G_N} b_{r_1 l_1}^* \dots b_{r_s l_s}^* \\
&= \sum_{r_x \leq L} \sum_{k_x} a_{k_1 i_1} \dots a_{k_s i_s} \int_{G_M} a_{r_1 k_1} \dots a_{r_s k_s} \otimes \sum_{l_x} b_{l_1 j_1}^* \dots b_{l_s j_s}^* \int_{G_N} b_{r_1 l_1}^* \dots b_{r_s l_s}^*
\end{aligned}$$

By using now the invariance property of the Haar functionals of G_M, G_N , we obtain:

$$\begin{aligned}
X &= \sum_{r_x \leq L} \left(\int_{G_M} \otimes id \right) \Delta(a_{r_1 i_1} \dots a_{r_s i_s}) \otimes \left(\int_{G_N} \otimes id \right) \Delta(b_{r_1 j_1}^* \dots b_{r_s j_s}^*) \\
&= \sum_{r_x \leq L} \int_{G_M} a_{r_1 i_1} \dots a_{r_s i_s} \int_{G_N} b_{r_1 j_1}^* \dots b_{r_s j_s}^* \\
&= \left(\int_{G_M} \otimes \int_{G_N} \right) \sum_{r_x \leq L} a_{r_1 i_1} \dots a_{r_s i_s} \otimes b_{r_1 j_1}^* \dots b_{r_s j_s}^*
\end{aligned}$$

But this gives the formula in the statement, and we are done. \square

We will prove now that the above functional is in fact the unique positive unital invariant trace on $C(G_{MN}^L)$. For this purpose, we will need the Weingarten formula:

THEOREM 5.25. *We have the Weingarten type formula*

$$\int_{G_{MN}^L} u_{i_1 j_1} \dots u_{i_s j_s} = \sum_{\pi \sigma \tau \nu} L^{|\pi \vee \tau|} \delta_\sigma(i) \delta_\nu(j) W_{sM}(\pi, \sigma) W_{sN}(\tau, \nu)$$

where the matrices on the right are given by $W_{sM} = G_{sM}^{-1}$, with $G_{sM}(\pi, \sigma) = M^{|\pi \vee \sigma|}$.

PROOF. We make use of the usual quantum group Weingarten formula, that we know from chapters 2-3. By using this formula for G_M, G_N , we obtain:

$$\begin{aligned}
\int_{G_{MN}^L} u_{i_1 j_1} \dots u_{i_s j_s} &= \sum_{l_1 \dots l_s \leq L} \int_{G_M} a_{l_1 i_1} \dots a_{l_s i_s} \int_{G_N} b_{l_1 j_1}^* \dots b_{l_s j_s}^* \\
&= \sum_{l_1 \dots l_s \leq L} \sum_{\pi \sigma} \delta_\pi(l) \delta_\sigma(i) W_{sM}(\pi, \sigma) \sum_{\tau \nu} \delta_\tau(l) \delta_\nu(j) W_{sN}(\tau, \nu) \\
&= \sum_{\pi \sigma \tau \nu} \left(\sum_{l_1 \dots l_s \leq L} \delta_\pi(l) \delta_\tau(l) \right) \delta_\sigma(i) \delta_\nu(j) W_{sM}(\pi, \sigma) W_{sN}(\tau, \nu)
\end{aligned}$$

The coefficient being $L^{|\pi \vee \tau|}$, we obtain the formula in the statement. \square

We can now derive an abstract characterization of the integration, as follows:

THEOREM 5.26. *The integration of G_{MN}^L is the unique positive unital trace*

$$C(G_{MN}^L) \rightarrow \mathbb{C}$$

which is invariant under the action of the quantum group $G_M \times G_N$.

PROOF. We use a standard method, from [11], the point being to show that we have the following ergodicity formula:

$$\left(id \otimes \int_{G_M} \otimes \int_{G_N} \right) \Phi(x) = \int_{G_{MN}^L} x$$

We restrict the attention to the orthogonal case, the proof in the unitary case being similar. We must verify that the following holds:

$$\left(id \otimes \int_{G_M} \otimes \int_{G_N} \right) \Phi(u_{i_1 j_1} \dots u_{i_s j_s}) = \int_{G_{MN}^L} u_{i_1 j_1} \dots u_{i_s j_s}$$

By using the Weingarten formula, the left term can be written as follows:

$$\begin{aligned} X &= \sum_{k_1 \dots k_s} \sum_{l_1 \dots l_s} u_{k_1 l_1} \dots u_{k_s l_s} \int_{G_M} a_{k_1 i_1} \dots a_{k_s i_s} \int_{G_N} b_{l_1 j_1}^* \dots b_{l_s j_s}^* \\ &= \sum_{k_1 \dots k_s} \sum_{l_1 \dots l_s} u_{k_1 l_1} \dots u_{k_s l_s} \sum_{\pi \sigma} \delta_\pi(k) \delta_\sigma(i) W_{sM}(\pi, \sigma) \sum_{\tau \nu} \delta_\tau(l) \delta_\nu(j) W_{sN}(\tau, \nu) \\ &= \sum_{\pi \sigma \tau \nu} \delta_\sigma(i) \delta_\nu(j) W_{sM}(\pi, \sigma) W_{sN}(\tau, \nu) \sum_{k_1 \dots k_s} \sum_{l_1 \dots l_s} \delta_\pi(k) \delta_\tau(l) u_{k_1 l_1} \dots u_{k_s l_s} \end{aligned}$$

By using now the summation formula in Theorem 5.25, we obtain:

$$X = \sum_{\pi \sigma \tau \nu} L^{|\pi \nu \tau|} \delta_\sigma(i) \delta_\nu(j) W_{sM}(\pi, \sigma) W_{sN}(\tau, \nu)$$

Now by comparing with the Weingarten formula for G_{MN}^L , this proves our claim. Assume now that $\tau : C(G_{MN}^L) \rightarrow \mathbb{C}$ satisfies the invariance condition. We have:

$$\begin{aligned} \tau \left(id \otimes \int_{G_M} \otimes \int_{G_N} \right) \Phi(x) &= \left(\tau \otimes \int_{G_M} \otimes \int_{G_N} \right) \Phi(x) \\ &= \left(\int_{G_M} \otimes \int_{G_N} \right) (\tau \otimes id) \Phi(x) \\ &= \left(\int_{G_M} \otimes \int_{G_N} \right) (\tau(x) 1) \\ &= \tau(x) \end{aligned}$$

On the other hand, according to the formula established above, we have as well:

$$\begin{aligned} \tau \left(id \otimes \int_{G_M} \otimes \int_{G_N} \right) \Phi(x) &= \tau(tr(x)1) \\ &= tr(x) \end{aligned}$$

Thus we obtain $\tau = tr$, and this finishes the proof. \square

As a main application of the above results, we have:

PROPOSITION 5.27. *For a sum of coordinates of the following type,*

$$\chi_E = \sum_{(ij) \in E} u_{ij}$$

with the coordinates not overlapping on rows and columns, we have

$$\int_{G_{MN}^L} \chi_E^s = \sum_{\pi\sigma\tau\nu} K^{|\pi\nu\tau|} L^{|\sigma\nu|} W_{sM}(\pi, \sigma) W_{sN}(\tau, \nu)$$

where $K = |E|$ is the cardinality of the indexing set.

PROOF. With $K = |E|$, we can write $E = \{(\alpha(i), \beta(i))\}$, for certain embeddings:

$$\alpha : \{1, \dots, K\} \subset \{1, \dots, M\}$$

$$\beta : \{1, \dots, K\} \subset \{1, \dots, N\}$$

In terms of these maps α, β , the moment in the statement is given by:

$$M_s = \int_{G_{MN}^L} \left(\sum_{i \leq K} u_{\alpha(i)\beta(i)} \right)^s$$

By using the Weingarten formula, we can write this quantity as follows:

$$\begin{aligned} &M_s \\ &= \int_{G_{MN}^L} \sum_{i_1 \dots i_s \leq K} u_{\alpha(i_1)\beta(i_1)} \dots u_{\alpha(i_s)\beta(i_s)} \\ &= \sum_{i_1 \dots i_s \leq K} \sum_{\pi\sigma\tau\nu} L^{|\sigma\nu|} \delta_\pi(\alpha(i_1), \dots, \alpha(i_s)) \delta_\tau(\beta(i_1), \dots, \beta(i_s)) W_{sM}(\pi, \sigma) W_{sN}(\tau, \nu) \\ &= \sum_{\pi\sigma\tau\nu} \left(\sum_{i_1 \dots i_s \leq K} \delta_\pi(i) \delta_\tau(i) \right) L^{|\sigma\nu|} W_{sM}(\pi, \sigma) W_{sN}(\tau, \nu) \end{aligned}$$

But, as explained before, in the proof of Theorem 5.25, the coefficient on the left in the last formula is $C = K^{|\pi\nu\tau|}$. We therefore obtain the formula in the statement. \square

At a more concrete level now, we have the following conceptual result, making the link with the Bercovici-Pata bijection [19]:

THEOREM 5.28. *In the context of the liberation operations*

$$O_{MN}^L \rightarrow O_{MN}^{L+}, \quad U_{MN}^L \rightarrow U_{MN}^{L+}, \quad H_{MN}^{sL} \rightarrow H_{MN}^{sL+}$$

the laws of the sums of non-overlapping coordinates,

$$\chi_E = \sum_{(ij) \in E} u_{ij}$$

are in Bercovici-Pata bijection, in the

$$|E| = \kappa N, L = \lambda N, M = \mu N$$

regime and $N \rightarrow \infty$ limit.

PROOF. This follows indeed from the formula in Proposition 5.27. □

CHAPTER 6

Affine spaces

6a. Affine spaces

We discuss now an abstract extension of the constructions of manifolds that we have so far. The idea will be that of looking at certain classes of algebraic manifolds $X \subset S_{\mathbb{C},+}^{N-1}$, which are homogeneous spaces, of a certain special type. We have:

DEFINITION 6.1. *An affine homogeneous space over a closed subgroup $G \subset U_N^+$ is a closed subset $X \subset S_{\mathbb{C},+}^{N-1}$, such that there exists an index set $I \subset \{1, \dots, N\}$ such that*

$$\alpha(x_i) = \frac{1}{\sqrt{|I|}} \sum_{j \in I} u_{ji} \quad , \quad \Phi(x_i) = \sum_j x_j \otimes u_{ji}$$

define morphisms of C^* -algebras, satisfying the following condition,

$$\left(id \otimes \int_G \right) \Phi = \int_G \alpha(\cdot) 1$$

called *ergodicity condition for the action*.

As a basic example, $O_N^+ \rightarrow S_{\mathbb{R},+}^{N-1}$ is indeed affine in our sense, with $I = \{1\}$. The same goes for $U_N^+ \rightarrow S_{\mathbb{C},+}^{N-1}$, which is affine as well, also with $I = \{1\}$. Observe also that the $1/\sqrt{|I|}$ constant appearing above is the correct one, because:

$$\begin{aligned} \sum_i \left(\sum_{j \in I} u_{ji} \right) \left(\sum_{k \in I} u_{ki} \right)^* &= \sum_i \sum_{j,k \in I} u_{ji} u_{ki}^* \\ &= \sum_{j,k \in I} (uu^*)_{jk} \\ &= |I| \end{aligned}$$

As a first general result about such spaces, we have:

PROPOSITION 6.2. *Consider an affine homogeneous space X , as above.*

- (1) *The coaction condition $(\Phi \otimes id)\Phi = (id \otimes \Delta)\Phi$ is satisfied.*
- (2) *We have as well the formula $(\alpha \otimes id)\Phi = \Delta\alpha$.*

PROOF. The coaction condition is clear. For the second formula, we first have:

$$\begin{aligned} (\alpha \otimes id)\Phi(x_i) &= \sum_k \alpha(x_k) \otimes u_{ki} \\ &= \frac{1}{\sqrt{|I|}} \sum_k \sum_{j \in I} u_{jk} \otimes u_{ki} \end{aligned}$$

On the other hand, we have as well the following computation:

$$\begin{aligned} \Delta\alpha(x_i) &= \frac{1}{\sqrt{|I|}} \sum_{j \in I} \Delta(u_{ji}) \\ &= \frac{1}{\sqrt{|I|}} \sum_{j \in I} \sum_k u_{jk} \otimes u_{ki} \end{aligned}$$

Thus, by linearity, multiplicativity and continuity, we obtain the result. \square

As a second result regarding such spaces, which closes the discussion in the case where α is injective, which is something that happens in many cases, we have:

THEOREM 6.3. *When α is injective we must have $X = X_{G,I}^{min}$, where:*

$$C(X_{G,I}^{min}) = \left\langle \frac{1}{\sqrt{|I|}} \sum_{j \in I} u_{ji} \mid i = 1, \dots, N \right\rangle \subset C(G)$$

Moreover, $X_{G,I}^{min}$ is affine homogeneous, for any $G \subset U_N^+$, and any $I \subset \{1, \dots, N\}$.

PROOF. The first assertion is clear from definitions. Regarding now the second assertion, consider the variables in the statement:

$$X_i = \frac{1}{\sqrt{|I|}} \sum_{j \in I} u_{ji} \in C(G)$$

In order to prove that we have $X_{G,I}^{min} \subset S_{C,+}^{N-1}$, observe first that we have:

$$\begin{aligned} \sum_i X_i X_i^* &= \frac{1}{|I|} \sum_i \sum_{j,k \in I} u_{ji} u_{ki}^* \\ &= \frac{1}{|I|} \sum_{j,k \in I} (uu^*)_{jk} \\ &= 1 \end{aligned}$$

On the other hand, we have as well the following computation:

$$\begin{aligned} \sum_i X_i^* X_i &= \frac{1}{|I|} \sum_i \sum_{j,k \in I} u_{ji}^* u_{ki} \\ &= \frac{1}{|I|} \sum_{j,k \in I} (\bar{u} u^t)_{jk} \\ &= 1 \end{aligned}$$

Thus $X_{G,I}^{min} \subset S_{\mathbb{C},+}^{N-1}$. Finally, observe that we have:

$$\begin{aligned} \Delta(X_i) &= \frac{1}{\sqrt{|I|}} \sum_{j \in I} \sum_k u_{jk} \otimes u_{ki} \\ &= \sum_k X_k \otimes u_{ki} \end{aligned}$$

Thus we have indeed a coaction map, given by $\Phi = \Delta$. As for the ergodicity condition, namely $(id \otimes \int_G) \Delta = \int_G(\cdot)1$, this holds as well, by definition of the integration functional \int_G . Thus, our axioms for affine homogeneous spaces are indeed satisfied. \square

Now back to the general case, we have the following key result:

PROPOSITION 6.4. *The ergodicity condition, namely*

$$\left(id \otimes \int_G \right) \Phi = \int_G \alpha(\cdot)1$$

is equivalent to the condition

$$(Px^{\otimes k})_{i_1 \dots i_k} = \frac{1}{\sqrt{|I|^k}} \sum_{j_1 \dots j_k \in I} P_{i_1 \dots i_k, j_1 \dots j_k} \quad , \quad \forall k, \forall i_1, \dots, i_k$$

where P is the matrix formed by the Peter-Weyl integrals of exponent k ,

$$P_{i_1 \dots i_k, j_1 \dots j_k} = \int_G u_{j_1 i_1}^{e_1} \dots u_{j_k i_k}^{e_k}$$

and where $(x^{\otimes k})_{i_1 \dots i_k} = x_{i_1}^{e_1} \dots x_{i_k}^{e_k}$.

PROOF. We have the following computation:

$$\begin{aligned} \left(id \otimes \int_G \right) \Phi(x_{i_1}^{e_1} \dots x_{i_k}^{e_k}) &= \sum_{j_1 \dots j_k} x_{j_1}^{e_1} \dots x_{j_k}^{e_k} \int_G u_{j_1 i_1}^{e_1} \dots u_{j_k i_k}^{e_k} \\ &= \sum_{j_1 \dots j_k} P_{i_1 \dots i_k, j_1 \dots j_k} (x^{\otimes k})_{j_1 \dots j_k} \\ &= (Px^{\otimes k})_{i_1 \dots i_k} \end{aligned}$$

On the other hand, we have as well the following computation:

$$\begin{aligned} \int_G \alpha(x_{i_1}^{e_1} \dots x_{i_k}^{e_k}) &= \frac{1}{\sqrt{|I|^k}} \sum_{j_1 \dots j_k \in I} \int_G u_{j_1 i_1}^{e_1} \dots u_{j_k i_k}^{e_k} \\ &= \frac{1}{\sqrt{|I|^k}} \sum_{j_1 \dots j_k \in I} P_{i_1 \dots i_k, j_1 \dots j_k} \end{aligned}$$

But this gives the formula in the statement, and we are done. \square

As a consequence, we have the following result:

THEOREM 6.5. *We must have $X \subset X_{G,I}^{max}$, as subsets of $S_{\mathbb{C},+}^{N-1}$, where:*

$$C(X_{G,I}^{max}) = C(S_{\mathbb{C},+}^{N-1}) / \left\langle (Px^{\otimes k})_{i_1 \dots i_k} = \frac{1}{\sqrt{|I|^k}} \sum_{j_1 \dots j_k \in I} P_{i_1 \dots i_k, j_1 \dots j_k} \mid \forall k, \forall i_1, \dots, i_k \right\rangle$$

Moreover, $X_{G,I}^{max}$ is affine homogeneous, for any $G \subset U_N^+$, and any $I \subset \{1, \dots, N\}$.

PROOF. Let us first prove that we have an action $G \curvearrowright X_{G,I}^{max}$. We must show here that the variables $X_i = \sum_j x_j \otimes u_{ji}$ satisfy the defining relations for $X_{G,I}^{max}$. We have:

$$\begin{aligned} (PX^{\otimes k})_{i_1 \dots i_k} &= \sum_{l_1 \dots l_k} P_{i_1 \dots i_k, l_1 \dots l_k} (X^{\otimes k})_{l_1 \dots l_k} \\ &= \sum_{l_1 \dots l_k} P_{i_1 \dots i_k, l_1 \dots l_k} \sum_{j_1 \dots j_k} x_{j_1}^{e_1} \dots x_{j_k}^{e_k} \otimes u_{j_1 l_1}^{e_1} \dots u_{j_k l_k}^{e_k} \\ &= \sum_{j_1 \dots j_k} x_{j_1}^{e_1} \dots x_{j_k}^{e_k} \otimes (u^{\otimes k} P^t)_{j_1 \dots j_k, i_1 \dots i_k} \end{aligned}$$

Since by Peter-Weyl the transpose of $P_{i_1 \dots i_k, j_1 \dots j_k} = \int_G u_{j_1 i_1}^{e_1} \dots u_{j_k i_k}^{e_k}$ is the orthogonal projection onto $Fix(u^{\otimes k})$, we have $u^{\otimes k} P^t = P^t$. We therefore obtain:

$$\begin{aligned} (PX^{\otimes k})_{i_1 \dots i_k} &= \sum_{j_1 \dots j_k} P_{i_1 \dots i_k, j_1 \dots j_k} x_{j_1}^{e_1} \dots x_{j_k}^{e_k} \\ &= (Px^{\otimes k})_{i_1 \dots i_k} \\ &= \frac{1}{\sqrt{|I|^k}} \sum_{j_1 \dots j_k \in I} P_{i_1 \dots i_k, j_1 \dots j_k} \end{aligned}$$

Thus we have an action $G \curvearrowright X_{G,I}^{max}$, and since this action is ergodic by Proposition 6.4, we have an affine homogeneous space, as claimed. \square

We can now merge the results that we have, and we obtain:

THEOREM 6.6. *Given a closed quantum subgroup $G \subset U_N^+$, and a set $I \subset \{1, \dots, N\}$, if we consider the following C^* -subalgebra and the following quotient C^* -algebra,*

$$C(X_{G,I}^{min}) = \left\langle \frac{1}{\sqrt{|I|}} \sum_{j \in I} u_{ji} \mid i = 1, \dots, N \right\rangle \subset C(G)$$

$$C(X_{G,I}^{max}) = C(S_{\mathbb{C},+}^{N-1}) / \left\langle (Px^{\otimes k})_{i_1 \dots i_k} = \frac{1}{\sqrt{|I|^k}} \sum_{j_1 \dots j_k \in I} P_{i_1 \dots i_k, j_1 \dots j_k} \mid \forall k, \forall i_1, \dots, i_k \right\rangle$$

then we have maps as follows,

$$G \rightarrow X_{G,I}^{min} \subset X_{G,I}^{max} \subset S_{\mathbb{C},+}^{N-1}$$

the space $G \rightarrow X_{G,I}^{max}$ is affine homogeneous, and any affine homogeneous space $G \rightarrow X$ appears as an intermediate space $X_{G,I}^{min} \subset X \subset X_{G,I}^{max}$.

PROOF. This follows indeed from the various results that we have, namely Theorem 6.3 and Theorem 6.5, regarding the minimal and maximal constructions. \square

At the level of the general theory, based on Definition 6.1, we will need as well:

THEOREM 6.7. *Assuming that $G \rightarrow X$ is an affine homogeneous space, with index set $I \subset \{1, \dots, N\}$, the Haar integration functional $\int_X = \int_G \alpha$ is given by*

$$\int_X x_{i_1}^{e_1} \dots x_{i_k}^{e_k} = \sum_{\pi, \sigma \in D} K_I(\pi) \overline{(\xi_\sigma)_{i_1 \dots i_k}} W_{kN}(\pi, \sigma)$$

where $\{\xi_\pi \mid \pi \in D\}$ is a basis of $Fix(u^{\otimes k})$, $W_{kN} = G_{kN}^{-1}$ with $G_{kN}(\pi, \sigma) = \langle \xi_\pi, \xi_\sigma \rangle$ is the associated Weingarten matrix, and $K_I(\pi) = \frac{1}{\sqrt{|I|^k}} \sum_{j_1 \dots j_k \in I} (\xi_\pi)_{j_1 \dots j_k}$.

PROOF. By using the Weingarten formula for the quantum group G , in its abstract form, coming from Peter-Weyl theory, we have:

$$\begin{aligned} \int_X x_{i_1}^{e_1} \dots x_{i_k}^{e_k} &= \frac{1}{\sqrt{|I|^k}} \sum_{j_1 \dots j_k \in I} \int_G u_{j_1 i_1}^{e_1} \dots u_{j_k i_k}^{e_k} \\ &= \frac{1}{\sqrt{|I|^k}} \sum_{j_1 \dots j_k \in I} \sum_{\pi, \sigma \in D} (\xi_\pi)_{j_1 \dots j_k} \overline{(\xi_\sigma)_{i_1 \dots i_k}} W_{kN}(\pi, \sigma) \end{aligned}$$

But this gives the formula in the statement, and we are done. \square

With this discussed, let us go back now to the “minimal vs maximal” discussion, in analogy with the group algebras. Here is a natural example of an intermediate space $X_{G,I}^{min} \subset X \subset X_{G,I}^{max}$, which will be of interest for us, in what follows:

THEOREM 6.8. *Given a closed quantum subgroup $G \subset U_N^+$, and a set $I \subset \{1, \dots, N\}$, if we consider the following quotient algebra*

$$C(X_{G,I}^{med}) = C(S_{\mathbb{C},+}^{N-1}) / \left\langle \sum_{j_1 \dots j_k} \xi_{j_1 \dots j_k} x_{j_1}^{e_1} \dots x_{j_k}^{e_k} = \frac{1}{\sqrt{|I|^k}} \sum_{j_1 \dots j_k \in I} \xi_{j_1 \dots j_k} \middle| \forall k, \forall \xi \in \text{Fix}(u^{\otimes k}) \right\rangle$$

we obtain in this way an affine homogeneous space $G \rightarrow X_{G,I}$.

PROOF. We know from Theorem 6.5 that $X_{G,I}^{max} \subset S_{\mathbb{C},+}^{N-1}$ is constructed by imposing to the standard coordinates the conditions $Px^{\otimes k} = P^I$, where:

$$P_{i_1 \dots i_k, j_1 \dots j_k} = \int_G u_{j_1 i_1}^{e_1} \dots u_{j_k i_k}^{e_k}$$

$$P_{i_1 \dots i_k}^I = \frac{1}{\sqrt{|I|^k}} \sum_{j_1 \dots j_k \in I} P_{i_1 \dots i_k, j_1 \dots j_k}$$

According to the Weingarten integration formula for G , we have:

$$(Px^{\otimes k})_{i_1 \dots i_k} = \sum_{j_1 \dots j_k} \sum_{\pi, \sigma \in D} (\xi_\pi)_{j_1 \dots j_k} \overline{(\xi_\sigma)_{i_1 \dots i_k}} W_{kN}(\pi, \sigma) x_{j_1}^{e_1} \dots x_{j_k}^{e_k}$$

$$P_{i_1 \dots i_k}^I = \frac{1}{\sqrt{|I|^k}} \sum_{j_1 \dots j_k \in I} \sum_{\pi, \sigma \in D} (\xi_\pi)_{j_1 \dots j_k} \overline{(\xi_\sigma)_{i_1 \dots i_k}} W_{kN}(\pi, \sigma)$$

Thus $X_{G,I}^{med} \subset X_{G,I}^{max}$, and the other assertions are standard as well. \square

We can now put everything together, as follows:

THEOREM 6.9. *Given a closed subgroup $G \subset U_N^+$, and a subset $I \subset \{1, \dots, N\}$, the affine homogeneous spaces over G , with index set I , have the following properties:*

- (1) *These are exactly the intermediate subspaces $X_{G,I}^{min} \subset X \subset X_{G,I}^{max}$ on which G acts affinely, with the action being ergodic.*
- (2) *For the minimal and maximal spaces $X_{G,I}^{min}$ and $X_{G,I}^{max}$, as well as for the intermediate space $X_{G,I}^{med}$ constructed above, these conditions are satisfied.*
- (3) *By performing the GNS construction with respect to the Haar integration functional $\int_X = \int_G \alpha$ we obtain the minimal space $X_{G,I}^{min}$.*

We agree to identify all these spaces, via the GNS construction, and denote them $X_{G,I}$.

PROOF. This follows indeed by combining the various results above. \square

6b. Basic examples

Let us discuss now some basic examples of affine homogeneous spaces, namely those coming from the classical groups, and those coming from group duals. We will need:

PROPOSITION 6.10. *Assuming that a closed subset $X \subset S_{\mathbb{C},+}^{N-1}$ is affine homogeneous over a classical group, $G \subset U_N$, then X itself must be classical, $X \subset S_{\mathbb{C}}^{N-1}$.*

PROOF. We use the well-known fact that, since the standard coordinates $u_{ij} \in C(G)$ commute, the corepresentation $u^{\circ\circ\bullet\bullet} = u^{\otimes 2} \otimes \bar{u}^{\otimes 2}$ has the following fixed vector:

$$\xi = \sum_{ij} e_i \otimes e_j \otimes e_i \otimes e_j$$

With $k = \circ\circ\bullet\bullet$ and with this vector ξ , the ergodicity formula reads:

$$\begin{aligned} \sum_{ij} x_i x_j x_i^* x_j^* &= \frac{1}{\sqrt{|I|^4}} \sum_{i,j \in I} 1 \\ &= 1 \end{aligned}$$

By using this formula, along with $\sum_i x_i x_i^* = \sum_i x_i^* x_i = 1$, we obtain:

$$\begin{aligned} &\sum_{ij} (x_i x_j - x_j x_i)(x_j^* x_i^* - x_i^* x_j^*) \\ &= \sum_{ij} x_i x_j x_j^* x_i^* - x_i x_j x_i^* x_j^* - x_j x_i x_j^* x_i^* + x_j x_i x_i^* x_j^* \\ &= 1 - 1 - 1 + 1 \\ &= 0 \end{aligned}$$

We conclude that for any i, j the following commutator vanishes:

$$[x_i, x_j] = 0$$

By using now this commutation relation, plus once again the relations defining the free sphere $S_{\mathbb{C},+}^{N-1}$, we have as well the following computation:

$$\begin{aligned} &\sum_{ij} (x_i x_j^* - x_j^* x_i)(x_j x_i^* - x_i^* x_j) \\ &= \sum_{ij} x_i x_j^* x_j x_i^* - x_i x_j^* x_i^* x_j - x_j^* x_i x_j x_i^* + x_j^* x_i x_i^* x_j \\ &= \sum_{ij} x_i x_j^* x_j x_i^* - x_i x_i^* x_j^* x_j - x_j^* x_j x_i x_i^* + x_j^* x_i x_i^* x_j \\ &= 1 - 1 - 1 + 1 \\ &= 0 \end{aligned}$$

Thus we have $[x_i, x_j^*] = 0$ as well, and so $X \subset S_{\mathbb{C}}^{N-1}$, as claimed. \square

We can now formulate the result in the classical case, as follows:

THEOREM 6.11. *In the classical case, $G \subset U_N$, there is only one affine homogeneous space, for each index set $I = \{1, \dots, N\}$, namely the quotient space*

$$X = G/(G \cap C_N^I)$$

where $C_N^I \subset U_N$ is the group of unitaries fixing the following vector,

$$\xi_I = \frac{1}{\sqrt{|I|}}(\delta_{i \in I})_i$$

which generalizes the complex bistochastic group, $C_N \subset U_N$.

PROOF. Consider an affine homogeneous space $G \rightarrow X$. We know from Proposition 6.10 that X is classical. We will first prove that we have $X = X_{G,I}^{min}$, and then we will prove that $X_{G,I}^{min}$ equals the quotient space in the statement.

(1) We use the well-known fact that the functional $E = (id \otimes \int_G)\Phi$ is the projection onto the fixed point algebra of the action, given by:

$$C(X)^\Phi = \left\{ f \in C(X) \mid \Phi(f) = f \otimes 1 \right\}$$

Thus our ergodicity condition, namely $E = \int_G \alpha(\cdot)1$, shows that we must have:

$$C(X)^\Phi = \mathbb{C}1$$

But in the classical case the condition $\Phi(f) = f \otimes 1$ reformulates as:

$$f(gx) = f(x) \quad , \quad \forall g \in G, x \in X$$

Thus, we recover in this way the usual ergodicity condition, stating that whenever a function $f \in C(X)$ is constant on the orbits of the action, it must be constant. Now observe that for an affine action, the orbits are closed. Thus an affine action which is ergodic must be transitive, and we deduce from this that we have:

$$X = X_{G,I}^{min}$$

(2) We know that the inclusion $C(X) \subset C(G)$ comes via:

$$x_i = \frac{1}{\sqrt{|I|}} \sum_{j \in I} u_{ji}$$

Thus, the quotient map $p : G \rightarrow X \subset S_{\mathbb{C}}^{N-1}$ is given by the following formula:

$$p(g) = \left(\frac{1}{\sqrt{|I|}} \sum_{j \in I} g_{ji} \right)_i$$

In particular, the image of the unit matrix $1 \in G$ is the following vector:

$$\begin{aligned} p(1) &= \left(\frac{1}{\sqrt{|I|}} \sum_{j \in I} \delta_{ji} \right)_i \\ &= \left(\frac{1}{\sqrt{|I|}} \delta_{i \in I} \right)_i \\ &= \xi_I \end{aligned}$$

But this gives the quotient space result in the statement.

(3) Finally, regarding the last assertion, stating that our group $C_N^I \subset U_N$ generalizes the complex bistochastic group $C_N \subset U_N$, this is more of a comment, coming from definitions. Indeed, C_N consists by definition of the unitary matrices $g \in U_N$ which are bistochastic, meaning having the same sums on rows and columns. But this bistochasticity condition is equivalent to the following condition, with ξ being the all-1 vector:

$$g\xi = \xi$$

Thus, our group $C_N^I \subset U_N$ generalizes indeed the group $C_N \subset U_N$, as claimed. \square

Let us discuss now the group dual case. For simplifying, we will discuss the case of the “diagonal” embeddings only. Given a finitely generated discrete group $\Gamma = \langle g_1, \dots, g_N \rangle$, we can consider the following “diagonal” embedding:

$$\widehat{\Gamma} \subset U_N^+ \quad , \quad u_{ij} = \delta_{ij} g_i$$

With this convention, we have the following result:

THEOREM 6.12. *In the group dual case, $G = \widehat{\Gamma}$ with $\Gamma = \langle g_1, \dots, g_N \rangle$, we have*

$$X = \widehat{\Gamma}_I \quad : \quad \Gamma_I = \langle g_i | i \in I \rangle \subset \Gamma$$

for any affine homogeneous space X , when identifying full and reduced group algebras.

PROOF. Assume indeed that we have an affine homogeneous space $G \rightarrow X$. In terms of the rescaled coordinates $h_i = \sqrt{|I|}x_i$, our axioms for α, Φ read:

$$\alpha(h_i) = \delta_{i \in I} g_i \quad , \quad \Phi(h_i) = h_i \otimes g_i$$

As for the ergodicity condition, this translates as follows:

$$\begin{aligned}
& \left(id \otimes \int_G \right) \Phi(h_{i_1}^{e_1} \dots h_{i_p}^{e_p}) = \int_G \alpha(h_{i_1}^{e_1} \dots h_{i_p}^{e_p}) \\
\iff & \left(id \otimes \int_G \right) (h_{i_1}^{e_1} \dots h_{i_p}^{e_p} \otimes g_{i_1}^{e_1} \dots g_{i_p}^{e_p}) = \int_G \delta_{i_1 \in I} \dots \delta_{i_p \in I} g_{i_1}^{e_1} \dots g_{i_p}^{e_p} \\
\iff & \delta_{g_{i_1}^{e_1} \dots g_{i_p}^{e_p}, 1} h_{i_1}^{e_1} \dots h_{i_p}^{e_p} = \delta_{g_{i_1}^{e_1} \dots g_{i_p}^{e_p}, 1} \delta_{i_1 \in I} \dots \delta_{i_p \in I} \\
\iff & \left[g_{i_1}^{e_1} \dots g_{i_p}^{e_p} = 1 \implies h_{i_1}^{e_1} \dots h_{i_p}^{e_p} = \delta_{i_1 \in I} \dots \delta_{i_p \in I} \right]
\end{aligned}$$

Now observe that from $g_i g_i^* = g_i^* g_i = 1$ we obtain in this way:

$$h_i h_i^* = h_i^* h_i = \delta_{i \in I}$$

Thus the elements h_i vanish for $i \notin I$, and are unitaries for $i \in I$. We conclude that we have $X = \widehat{\Lambda}$, where $\Lambda = \langle h_i | i \in I \rangle$ is the group generated by these unitaries. In order to finish now the proof, our claim is that for indices $i_x \in I$ we have:

$$g_{i_1}^{e_1} \dots g_{i_p}^{e_p} = 1 \iff h_{i_1}^{e_1} \dots h_{i_p}^{e_p} = 1$$

Indeed, \implies comes from the ergodicity condition, as processed above, and \impliedby comes from the existence of the morphism α , which is given by $\alpha(h_i) = g_i$, for $i \in I$. \square

Let us go back now to the general case, and discuss a number of further axiomatization issues, based on the examples that we have. We will need the following result:

PROPOSITION 6.13. *The closed subspace $C_N^{I+} \subset U_N^+$ defined via*

$$C(C_N^{I+}) = C(U_N^+) / \langle u_{\xi_I} = \xi_I \rangle$$

where $\xi_I = \frac{1}{\sqrt{|I|}} (\delta_{i \in I})_i$, is a compact quantum group.

PROOF. We must check Woronowicz's axioms, and the proof goes as follows:

(1) Let us set $U_{ij} = \sum_k u_{ik} \otimes u_{kj}$. We have then:

$$\begin{aligned}
(U_{\xi_I})_i &= \frac{1}{\sqrt{|I|}} \sum_{j \in I} U_{ij} \\
&= \frac{1}{\sqrt{|I|}} \sum_{j \in I} \sum_k u_{ik} \otimes u_{kj} \\
&= \sum_k u_{ik} \otimes (u_{\xi_I})_k
\end{aligned}$$

Since the vector ξ_I is by definition fixed by u , we obtain:

$$\begin{aligned} (U\xi_I)_i &= \sum_k u_{ik} \otimes (\xi_I)_k \\ &= \frac{1}{\sqrt{|I|}} \sum_{k \in I} u_{ik} \otimes 1 \\ &= (u\xi_I)_i \otimes 1 \\ &= (\xi_I)_i \otimes 1 \end{aligned}$$

Thus we can define indeed a comultiplication map, by $\Delta(u_{ij}) = U_{ij}$.

(2) In order to construct the counit map, $\varepsilon(u_{ij}) = \delta_{ij}$, we must prove that the identity matrix $1 = (\delta_{ij})_{ij}$ satisfies $1\xi_I = \xi_I$. But this is clear.

(3) In order to construct the antipode, $S(u_{ij}) = u_{ji}^*$, we must prove that the adjoint matrix $u^* = (u_{ji}^*)_{ij}$ satisfies $u^*\xi_I = \xi_I$. But this is clear from $u\xi_I = \xi_I$. \square

Based on the computations that we have so far, we can formulate:

THEOREM 6.14. *Given a closed quantum subgroup $G \subset U_N^+$ and a set $I \subset \{1, \dots, N\}$, we have a quotient map and an inclusion map as follows:*

$$G/(G \cap C_N^{I+}) \rightarrow X_{G,I}^{min} \subset X_{G,I}^{max}$$

These maps are both isomorphisms in the classical case. In general, they are both proper.

PROOF. Consider the quantum group $H = G \cap C_N^{I+}$, which is by definition such that at the level of the corresponding algebras, we have:

$$C(H) = C(G) / \langle u\xi_I = \xi_I \rangle$$

In order to construct a quotient map $G/H \rightarrow X_{G,I}^{min}$, we must check that the defining relations for $C(G/H)$ hold for the standard generators $x_i \in C(X_{G,I}^{min})$. But if we denote by $\rho : C(G) \rightarrow C(H)$ the quotient map, then we have, as desired:

$$\begin{aligned} (id \otimes \rho)\Delta x_i &= (id \otimes \rho) \left(\frac{1}{\sqrt{|I|}} \sum_{j \in I} \sum_k u_{ik} \otimes u_{kj} \right) \\ &= \sum_k u_{ik} \otimes (\xi_I)_k \\ &= x_i \otimes 1 \end{aligned}$$

In the classical case, Theorem 6.11 shows that both the maps in the statement are isomorphisms. For the group duals, however, these maps are not isomorphisms, in general. This follows indeed from Theorem 6.12, and from some basic computations. \square

We discuss now a number of further examples. We will need:

PROPOSITION 6.15. *Given a compact matrix quantum group $G = (G, u)$, the pair*

$$G^t = (G, u^t)$$

where $(u^t)_{ij} = u_{ji}$, is a compact matrix quantum group as well.

PROOF. The construction of the comultiplication is as follows, where Σ is the flip:

$$\begin{aligned} \Delta^t[(u^t)_{ij}] &= \sum_k (u^t)_{ik} \otimes (u^t)_{kj} \iff \Delta^t(u_{ji}) = \sum_k u_{ki} \otimes u_{jk} \\ &\iff \Delta^t = \Sigma\Delta \end{aligned}$$

As for the corresponding counit and antipode, these can be simply taken to be (ε, S) , and the axioms of Woronowicz are then satisfied. \square

We will need as well the following result, which is standard too:

PROPOSITION 6.16. *Given closed subgroups $G \subset U_N^+$ and $H \subset U_M^+$, with fundamental corepresentations $u = (u_{ij})$ and $v = (v_{ab})$, their product is a closed subgroup*

$$G \times H \subset U_{NM}^+$$

with fundamental corepresentation $w_{ia,jb} = u_{ij} \otimes v_{ab}$.

PROOF. Our claim is that the corresponding structural maps are as follows:

$$\Delta(\alpha \otimes \beta) = \Delta(\alpha)_{13}\Delta(\beta)_{24}$$

$$\varepsilon(\alpha \otimes \beta) = \varepsilon(\alpha)\varepsilon(\beta)$$

$$S(\alpha \otimes \beta) = S(\alpha)S(\beta)$$

Indeed, the verification for the comultiplication goes as follows:

$$\begin{aligned} \Delta(w_{ia,jb}) &= \Delta(u_{ij})_{13}\Delta(v_{ab})_{24} \\ &= \sum_{kc} u_{ik} \otimes v_{ac} \otimes u_{kj} \otimes v_{cb} \\ &= \sum_{kc} w_{ia,kc} \otimes w_{kc,jb} \end{aligned}$$

For the counit, we have the following computation:

$$\begin{aligned} \varepsilon(w_{ia,jb}) &= \varepsilon(u_{ij})\varepsilon(v_{ab}) \\ &= \delta_{ij}\delta_{ab} \\ &= \delta_{ia,jb} \end{aligned}$$

As for the antipode, here we have the following computation:

$$\begin{aligned} S(w_{ia,jb}) &= S(u_{ij})S(v_{ab}) \\ &= v_{ba}^* u_{ji}^* \\ &= (u_{ji} v_{ba})^* \\ &= w_{jb,ia}^* \end{aligned}$$

We refer to Wang's paper [89] for more details regarding this construction. \square

We will need one more ingredient, which is a definition, as follows:

DEFINITION 6.17. *We call a closed quantum subgroup $G \subset U_N^+$ self-transpose when we have an automorphism $T : C(G) \rightarrow C(G)$ given by $T(u_{ij}) = u_{ji}$.*

With the above notions and general theory in hand, let us go back to the affine homogeneous spaces. As a first result here, any closed subgroup $G \subset U_N^+$ appears as an affine homogeneous space over an appropriate quantum group, as follows:

THEOREM 6.18. *Given a closed subgroup $G \subset U_N^+$, we have an identification*

$$X_{\mathcal{G},I}^{min} \simeq G$$

given at the level of standard coordinates by $x_{ij} = \frac{1}{\sqrt{N}} u_{ij}$, where:

- (1) $\mathcal{G} = G^t \times G \subset U_{N^2}^+$, with coordinates $w_{ia,jb} = u_{ji} \otimes u_{ab}$.
- (2) $I \subset \{1, \dots, N\}^2$ is the diagonal set, $I = \{(k, k) | k = 1, \dots, N\}$.

In the self-transpose case we can choose as well $\mathcal{G} = G \times G$, with $w_{ia,jb} = u_{ij} \otimes u_{ab}$.

PROOF. As a first observation, our closed subgroup $G \subset U_N^+$ appears as an algebraic submanifold of the free complex sphere on N^2 variables, as follows:

$$G \subset S_{\mathbb{C},+}^{N^2-1} \quad , \quad x_{ij} = \frac{1}{\sqrt{N}} u_{ij}$$

Let us construct now the affine homogeneous space structure. Our claim is that, with $\mathcal{G} = G^t \times G$ and $I = \{(k, k)\}$ as in the statement, the structural maps are:

$$\alpha = \Delta \quad , \quad \Phi = (\Sigma \otimes id)\Delta^{(2)}$$

Indeed, in what regards $\alpha = \Delta$, this is given by the following formula:

$$\alpha(u_{ij}) = \sum_k u_{ik} \otimes u_{kj} = \sum_k w_{kk,ij}$$

Thus, by dividing by \sqrt{N} , we obtain the usual affine homogeneous space formula:

$$\alpha(x_{ij}) = \frac{1}{\sqrt{|I|}} \sum_k w_{kk,ij}$$

Regarding now $\Phi = (\Sigma \otimes id)\Delta^{(2)}$, the formula here is as follows:

$$\begin{aligned}\Phi(u_{ij}) &= (\Sigma \otimes id) \sum_{kl} u_{ik} \otimes u_{kl} \otimes u_{lj} \\ &= \sum_{kl} u_{kl} \otimes u_{ik} \otimes u_{lj} \\ &= \sum_{kl} u_{kl} \otimes w_{kl,ij}\end{aligned}$$

Thus, by dividing by \sqrt{N} , we obtain the usual affine homogeneous space formula:

$$\Phi(x_{ij}) = \sum_{kl} x_{kl} \otimes w_{kl,ij}$$

The ergodicity condition being clear as well, this gives the first assertion. Regarding now the second assertion, assume that we are in the self-transpose case, and so that we have an automorphism $T : C(G) \rightarrow C(G)$ given by $T(u_{ij}) = u_{ji}$. With $w_{ia,jb} = u_{ij} \otimes u_{ab}$, the modified map $\alpha = (T \otimes id)\Delta$ is then given by the following formula:

$$\begin{aligned}\alpha(u_{ij}) &= (T \otimes id) \sum_k u_{ik} \otimes u_{kj} \\ &= \sum_k u_{ki} \otimes u_{kj} \\ &= \sum_k w_{kk,ij}\end{aligned}$$

As for the modified map $\Phi = (id \otimes T \otimes id)(\Sigma \otimes id)\Delta^{(2)}$, this is given by:

$$\begin{aligned}\Phi(u_{ij}) &= (id \otimes T \otimes id) \sum_{kl} u_{kl} \otimes u_{ik} \otimes u_{lj} \\ &= \sum_{kl} u_{kl} \otimes u_{ki} \otimes u_{lj} \\ &= \sum_{kl} u_{kl} \otimes w_{kl,ij}\end{aligned}$$

Thus we have the correct affine homogeneous space formulae, and once again the ergodicity condition being clear as well, this gives the result. \square

Let us discuss now the generalization of the above result. We have:

DEFINITION 6.19. *Given a closed subgroup $G \subset U_N^+$ and an integer $M \leq N$ we set*

$$C(G_{MN}) = \left\langle u_{ij} \mid i \in \{1, \dots, M\}, j \in \{1, \dots, N\} \right\rangle \subset C(G)$$

and we call row space of G the underlying quotient space $G \rightarrow G_{MN}$.

As a basic example here, at $M = N$ we obtain the quantum group G itself. Also, at $M = 1$ we obtain the space whose coordinates are those on the first row of coordinates on G . Finally, in the case of the basic quantum unitary and reflection groups, these are particular cases of the partial isometry spaces discussed in chapter 5.

Given $G_N \subset U_N^+$ and an integer $M \leq N$, we can consider the quantum group $G_M = G_N \cap U_M^+$, with the intersection taken inside U_N^+ , and with $U_M^+ \subset U_N^+$ given by:

$$u = \text{diag}(v, 1_{N-M})$$

Observe that we have a quotient map $C(G_N) \rightarrow C(G_M)$, given by $u_{ij} \rightarrow v_{ij}$. With these conventions, we have the following extension of Theorem 6.18:

THEOREM 6.20. *Given a closed subgroup $G_N \subset U_N^+$, we have an identification*

$$X_{\mathcal{G}, I}^{\min} \simeq G_{MN}$$

given at the level of standard coordinates by $x_{ij} = \frac{1}{\sqrt{M}}u_{ij}$, where:

(1) $\mathcal{G} = G_M^t \times G_N \subset U_{NM}^+$, where $G_M = G_N \cap U_M^+$, with coordinates as follows:

$$w_{ia,jb} = u_{ji} \otimes v_{ab}$$

(2) $I \subset \{1, \dots, M\} \times \{1, \dots, N\}$ is the diagonal set, namely:

$$I = \left\{ (k, k) \mid k = 1, \dots, M \right\}$$

In the self-transpose case we can choose as well $\mathcal{G} = G_M \times G_N$, with $w_{ia,jb} = u_{ij} \otimes v_{ab}$.

PROOF. Consider the row space $X = G_{MN}$ constructed in Definition 6.19, with its standard row space coordinates, namely:

$$x_{ij} = \frac{1}{\sqrt{M}}u_{ij}$$

In order to prove the result, we have to show that this space coincides with the space $X_{\mathcal{G}, I}^{\min}$ constructed in the statement, with its standard coordinates. For this purpose, consider the following composition of morphisms, where in the middle we have the comultiplication, and at left and right we have the canonical maps:

$$C(X) \subset C(G_N) \rightarrow C(G_N) \otimes C(G_N) \rightarrow C(G_M) \otimes C(G_N)$$

The standard coordinates are then mapped as follows:

$$\begin{aligned}
x_{ij} &= \frac{1}{\sqrt{M}} u_{ij} \\
&\rightarrow \frac{1}{\sqrt{M}} \sum_k u_{ik} \otimes u_{kj} \\
&\rightarrow \frac{1}{\sqrt{M}} \sum_{k \leq M} u_{ik} \otimes v_{kj} \\
&= \frac{1}{\sqrt{M}} \sum_{k \leq M} w_{kk,ij}
\end{aligned}$$

Thus we obtain the standard coordinates on the space $X_{\mathcal{G},I}^{min}$, as claimed. Finally, the last assertion is standard as well, by suitably modifying the above morphism. \square

6c. Integration results

In the easy case, we have the following result:

PROPOSITION 6.21. *When $G \subset U_N^+$ is easy, coming from a category of partitions D , the space $X_{G,I} \subset S_{\mathbb{C},+}^{N-1}$ appears by imposing the relations*

$$\sum_{i_1 \dots i_k} \delta_\pi(i_1 \dots i_k) x_{i_1}^{e_1} \dots x_{i_k}^{e_k} = |I|^{| \pi | - k/2}, \quad \forall k, \forall \pi \in D(k)$$

where $D(k) = D(0, k)$, and where $| \cdot |$ denotes the number of blocks.

PROOF. We know by easiness that $Fix(u^{\otimes k})$ is spanned by the vectors $\xi_\pi = T_\pi$, with $\pi \in D(k)$. But these latter vectors are given by:

$$\xi_\pi = \sum_{i_1 \dots i_k} \delta_\pi(i_1 \dots i_k) e_{i_1} \otimes \dots \otimes e_{i_k}$$

We deduce that $X_{G,I} \subset S_{\mathbb{C},+}^{N-1}$ appears by imposing the following relations:

$$\sum_{i_1 \dots i_k} \delta_\pi(i_1 \dots i_k) x_{i_1}^{e_1} \dots x_{i_k}^{e_k} = \frac{1}{\sqrt{|I|^k}} \sum_{j_1 \dots j_k \in I} \delta_\pi(j_1 \dots j_k), \quad \forall k, \forall \pi \in D(k)$$

Now since the sum on the right equals $|I|^{| \pi |}$, this gives the result. \square

More generally, it is interesting to work out what happens when G is a product of easy quantum groups, and the index set I appears as follows, for a certain set J :

$$I = \{(c, \dots, c) | c \in J\}$$

The result here, in its most general form, is as follows:

THEOREM 6.22. *For a product of easy quantum groups $G = G_{N_1}^{(1)} \times \dots \times G_{N_s}^{(s)}$, and with $I = \{(c, \dots, c) | c \in J\}$, the space $X_{G,I} \subset S_{\mathbb{C},+}^{N-1}$ appears via the relations*

$$\sum_{i_1 \dots i_k} \delta_\pi(i_1 \dots i_k) x_{i_1}^{e_1} \dots x_{i_k}^{e_k} = |J|^{|\pi_1 \vee \dots \vee \pi_s| - k/2}$$

for any $k \in \mathbb{N}$ and any partition of type $\pi \in D^{(1)}(k) \times \dots \times D^{(s)}(k)$, where $D^{(r)} \subset P$ is the category of partitions associated to $G_{N_r}^{(r)} \subset U_{N_r}^+$, and where

$$\pi_1 \vee \dots \vee \pi_s \in P(k)$$

is the partition obtained by superposing π_1, \dots, π_s .

PROOF. Since we are in a direct product situation, a basis for $Fix(u^{\otimes k})$ is provided by the vectors $\rho_\pi = \xi_{\pi_1} \otimes \dots \otimes \xi_{\pi_s}$ associated to the following partitions:

$$\pi = (\pi_1, \dots, \pi_s) \in D^{(1)}(k) \times \dots \times D^{(s)}(k)$$

We conclude that the space $X_{G,I} \subset S_{\mathbb{C},+}^{N-1}$ appears by imposing the following relations to the standard coordinates:

$$\sum_{i_1 \dots i_k} \delta_\pi(i_1 \dots i_k) x_{i_1}^{e_1} \dots x_{i_k}^{e_k} = \frac{1}{\sqrt{|I|^k}} \sum_{j_1 \dots j_k \in I} \delta_\pi(j_1 \dots j_k), \quad \forall k, \forall \pi \in D^{(1)}(k) \times \dots \times D^{(s)}(k)$$

Since the conditions $j_1, \dots, j_k \in I$ read $j_1 = (l_1, \dots, l_1), \dots, j_k = (l_k, \dots, l_k)$, for certain elements $l_1, \dots, l_k \in J$, the sums on the right are given by:

$$\begin{aligned} \sum_{j_1 \dots j_k \in I} \delta_\pi(j_1 \dots j_k) &= \sum_{l_1 \dots l_k \in J} \delta_\pi(l_1, \dots, l_1, \dots, l_k, \dots, l_k) \\ &= \sum_{l_1 \dots l_k \in J} \delta_{\pi_1}(l_1 \dots l_k) \dots \delta_{\pi_s}(l_1 \dots l_k) \\ &= \sum_{l_1 \dots l_k \in J} \delta_{\pi_1 \vee \dots \vee \pi_s}(l_1 \dots l_k) \end{aligned}$$

Now since the sum on the right equals $|J|^{|\pi_1 \vee \dots \vee \pi_s|}$, this gives the result. \square

We can now discuss probabilistic aspects. We first have:

PROPOSITION 6.23. *The moments of the variable*

$$\chi_T = \sum_{i \leq T} x_{i \dots i}$$

are given by the following formula,

$$\int_X \chi_T^k \simeq \frac{1}{\sqrt{M^k}} \sum_{\pi \in D^{(1)}(k) \cap \dots \cap D^{(s)}(k)} \left(\frac{TM}{N} \right)^{|\pi|}$$

in the $N_i \rightarrow \infty$ limit, $\forall i$, where $M = |I|$, and $N = N_1 \dots N_s$.

PROOF. We have the following formula:

$$\pi(x_{i_1 \dots i_s}) = \frac{1}{\sqrt{M}} \sum_{c \in J} u_{i_1 c} \otimes \dots \otimes u_{i_s c}$$

For the variable in the statement, we therefore obtain:

$$\pi(\chi_T) = \frac{1}{\sqrt{M}} \sum_{i \leq T} \sum_{c \in J} u_{ic} \otimes \dots \otimes u_{ic}$$

Now by raising to the power k and integrating, we obtain:

$$\begin{aligned} \int_X \chi_T^k &= \frac{1}{\sqrt{M^k}} \sum_{i_1 \dots i_k \leq T} \sum_{c_1 \dots c_k \in J} \int_{G^{(1)}} u_{i_1 c_1} \dots u_{i_k c_k} \dots \int_{G^{(s)}} u_{i_1 c_1} \dots u_{i_k c_k} \\ &= \frac{1}{\sqrt{M^k}} \sum_{ic} \sum_{\pi\sigma} \delta_{\pi_1}(i) \delta_{\sigma_1}(c) W_{kN_1}^{(1)}(\pi_1, \sigma_1) \dots \delta_{\pi_s}(i) \delta_{\sigma_s}(c) W_{kN_s}^{(s)}(\pi_s, \sigma_s) \\ &= \frac{1}{\sqrt{M^k}} \sum_{\pi\sigma} T^{|\pi_1 \vee \dots \vee \pi_s|} M^{|\sigma_1 \vee \dots \vee \sigma_s|} W_{kN_1}^{(1)}(\pi_1, \sigma_1) \dots W_{kN_s}^{(s)}(\pi_s, \sigma_s) \end{aligned}$$

We use now the standard fact that the Weingarten functions are concentrated on the diagonal. Thus in the limit we must have $\pi_i = \sigma_i$ for any i , and we obtain:

$$\begin{aligned} \int_X \chi_T^k &\simeq \frac{1}{\sqrt{M^k}} \sum_{\pi} T^{|\pi_1 \vee \dots \vee \pi_s|} M^{|\pi_1 \vee \dots \vee \pi_s|} N_1^{-|\pi_1|} \dots N_s^{-|\pi_s|} \\ &\simeq \frac{1}{\sqrt{M^k}} \sum_{\pi \in D^{(1)} \cap \dots \cap D^{(s)}} T^{|\pi|} M^{|\pi|} (N_1 \dots N_s)^{-|\pi|} \\ &= \frac{1}{\sqrt{M^k}} \sum_{\pi \in D^{(1)} \cap \dots \cap D^{(s)}} \left(\frac{TM}{N} \right)^{|\pi|} \end{aligned}$$

But this gives the formula in the statement, and we are done. \square

As a consequence, we have the following result:

THEOREM 6.24. *In the context of a liberation operation for quantum groups*

$$G^{(i)} \rightarrow G^{(i)+}$$

the laws of the variables $\sqrt{M}\chi_T$ are in Bercovici-Pata bijection, in the $N_i \rightarrow \infty$ limit.

PROOF. Assume indeed that we have easy quantum groups $G^{(1)}, \dots, G^{(s)}$, with free versions $G^{(1)+}, \dots, G^{(s)+}$. At the level of the categories of partitions, we have:

$$\bigcap_i (D^{(i)} \cap NC) = \left(\bigcap_i D^{(i)} \right) \cap NC$$

Since the intersection of Hom-spaces is the Hom-space for the generated quantum group, we deduce that at the quantum group level, we have:

$$\langle G^{(1)+}, \dots, G^{(s)+} \rangle = \langle G^{(1)}, \dots, G^{(s)} \rangle^+$$

Thus the result follows from Proposition 6.23, and from the Bercovici-Pata bijection result for truncated characters for this latter liberation operation. \square

6d. Tannakian duality

As a starting point here, we have the following simple fact:

PROPOSITION 6.25. *Any affine homogeneous space $X_{G,I} \subset S_{\mathbb{C},+}^{N-1}$ is algebraic, with*

$$\sum_{i_1 \dots i_k} \xi_{i_1 \dots i_k} x_{i_1}^{e_1} \dots x_{i_k}^{e_k} = \frac{1}{\sqrt{|I|^k}} \sum_{b_1 \dots b_k \in I} \xi_{b_1 \dots b_k} \quad \forall k, \forall \xi \in \text{Fix}(u^{\otimes k})$$

as defining relations. Moreover, we can use vectors ξ belonging to a basis of $\text{Fix}(u^{\otimes k})$.

PROOF. This follows indeed from the various results above. \square

In order to reach to a more categorical description of $X_{G,I}$, the idea will be that of using Frobenius duality. We use colored indices, and we denote by $k \rightarrow \bar{k}$ the operation on the colored indices which consists in reversing the index, and switching all the colors. Also, we agree to identify the linear maps $T : (\mathbb{C}^N)^{\otimes k} \rightarrow (\mathbb{C}^N)^{\otimes l}$ with the corresponding rectangular matrices $T \in M_{N^l \times N^k}(\mathbb{C})$, written $T = (T_{i_1 \dots i_l, j_1 \dots j_k})$. With these conventions, the precise formulation of Frobenius duality that we will need is as follows:

PROPOSITION 6.26. *We have an isomorphism of complex vector spaces*

$$T \in \text{Hom}(u^{\otimes k}, u^{\otimes l}) \leftrightarrow \xi \in \text{Fix}(u^{\otimes l} \otimes u^{\otimes \bar{k}})$$

given by the following formulae,

$$T_{i_1 \dots i_l, j_1 \dots j_k} = \xi_{i_1 \dots i_l, j_k \dots j_1} \quad , \quad \xi_{i_1 \dots i_l, j_1 \dots j_k} = T_{i_1 \dots i_l, j_k \dots j_1}$$

and called Frobenius duality.

PROOF. This is a well-known result, which follows from the general theory in [99]. To be more precise, given integers $K, L \in \mathbb{N}$, consider the following standard isomorphism, which in matrix notation makes $T = (T_{IJ}) \in M_{L \times K}(\mathbb{C})$ correspond to $\xi = (\xi_{IJ})$:

$$T \in \mathcal{L}(\mathbb{C}^{\otimes K}, \mathbb{C}^{\otimes L}) \leftrightarrow \xi \in \mathbb{C}^{\otimes L+K}$$

Given now two arbitrary corepresentations $v \in M_K(C(G))$ and $w \in M_L(C(G))$, the abstract Frobenius duality result established by Woronowicz in [99] states that the above isomorphism restricts into an isomorphism of vector spaces, as follows:

$$T \in \text{Hom}(v, w) \leftrightarrow \xi \in \text{Fix}(w \otimes \bar{v})$$

In our case, we can apply this result with $v = u^{\otimes k}$ and $w = u^{\otimes l}$. Since, according to our conventions, we have $\bar{v} = u^{\otimes \bar{k}}$, this gives the isomorphism in the statement. \square

With the above result in hand, we can enhance the construction of $X_{G,I}$, as follows:

THEOREM 6.27. *Any affine homogeneous space $X_{G,I}$ is algebraic, with*

$$\sum_{i_1 \dots i_l} \sum_{j_1 \dots j_k} T_{i_1 \dots i_l, j_1 \dots j_k} x_{i_1}^{e_1} \dots x_{i_l}^{e_l} (x_{j_1}^{f_1} \dots x_{j_k}^{f_k})^* = \frac{1}{\sqrt{|I|^{k+l}}} \sum_{b_1 \dots b_l \in I} \sum_{c_1 \dots c_k \in I} T_{b_1 \dots b_l, c_1 \dots c_k}$$

for any k, l , and any $T \in \text{Hom}(u^{\otimes k}, u^{\otimes l})$, as defining relations.

PROOF. We must prove that the relations in the statement are satisfied, over $X_{G,I}$. We know from Proposition 6.25 that, with $k \rightarrow \bar{k}$, the following relation holds:

$$\sum_{i_1 \dots i_l} \sum_{j_1 \dots j_k} \xi_{i_1 \dots i_l, j_1 \dots j_k} x_{i_1}^{e_1} \dots x_{i_l}^{e_l} x_{j_1}^{\bar{f}_1} \dots x_{j_k}^{\bar{f}_k} = \frac{1}{\sqrt{|I|^{k+l}}} \sum_{b_1 \dots b_l \in I} \sum_{c_1 \dots c_k \in I} \xi_{b_1 \dots b_l, c_1 \dots c_k}$$

In terms of the matrix $T_{i_1 \dots i_l, j_1 \dots j_k} = \xi_{i_1 \dots i_l, j_1 \dots j_k}$ from Proposition 6.26, we obtain:

$$\sum_{i_1 \dots i_l} \sum_{j_1 \dots j_k} T_{i_1 \dots i_l, j_1 \dots j_k} x_{i_1}^{e_1} \dots x_{i_l}^{e_l} x_{j_1}^{\bar{f}_1} \dots x_{j_k}^{\bar{f}_k} = \frac{1}{\sqrt{|I|^{k+l}}} \sum_{b_1 \dots b_l \in I} \sum_{c_1 \dots c_k \in I} T_{b_1 \dots b_l, c_1 \dots c_k}$$

But this gives the formula in the statement, and we are done. \square

The above results suggest the following notion:

DEFINITION 6.28. *Given a submanifold $X \subset S_{\mathbb{C},+}^{N-1}$ and a subset $I \subset \{1, \dots, N\}$, we say that X is I -affine when $C(X)$ is presented by relations of type*

$$\sum_{i_1 \dots i_l} \sum_{j_1 \dots j_k} T_{i_1 \dots i_l, j_1 \dots j_k} x_{i_1}^{e_1} \dots x_{i_l}^{e_l} (x_{j_1}^{f_1} \dots x_{j_k}^{f_k})^* = \frac{1}{\sqrt{|I|^{k+l}}} \sum_{b_1 \dots b_l \in I} \sum_{c_1 \dots c_k \in I} T_{b_1 \dots b_l, c_1 \dots c_k}$$

with the operators T belonging to certain linear spaces

$$F(k, l) \subset M_{N^l \times N^k}(\mathbb{C})$$

which altogether form a tensor category $F = (F(k, l))$.

According to Theorem 6.27, any affine homogeneous space $X_{G,I}$ is an I -affine manifold, with the corresponding tensor category being the one associated to the quantum group $G \subset U_N^+$ which produces it, formed by the following linear spaces:

$$F(k, l) = \text{Hom}(u^{\otimes k}, u^{\otimes l})$$

Let us study now the quantum isometry groups $G^+(X)$ of the manifolds $X \subset S_{\mathbb{C},+}^{N-1}$ which are I -affine, in the above sense. We have here the following result:

PROPOSITION 6.29. *For an I -affine manifold $X \subset S_{\mathbb{C},+}^{N-1}$ we have*

$$G \subset G^+(X)$$

where $G \subset U_N^+$ is the Tannakian dual of the associated tensor category F .

PROOF. We recall from chapter 5 that the relations defining $G^+(X)$ are those expressing the vanishing of the following quantities:

$$P(X_1, \dots, X_N) = \sum_r \alpha_r \sum_{j_1^r \dots j_{s(r)}^r} u_{i_1^r j_1^r} \dots u_{i_{s(r)}^r j_{s(r)}^r} \otimes x_{j_1^r} \dots x_{j_{s(r)}^r}$$

In the case of an I -affine manifold, the defining relations are those from Definition 6.28, with the corresponding polynomials P being indexed by the elements of F . But the vanishing of the associated relations $P(X_1, \dots, X_N) = 0$ corresponds precisely to the Tannakian relations defining $G \subset U_N^+$, and so we obtain $G \subset G^+(X)$, as claimed. \square

We have now all the needed ingredients, and we can prove:

THEOREM 6.30. *Assuming that an algebraic manifold $X \subset S_{\mathbb{C},+}^{N-1}$ is I -affine, with associated tensor category F , the following happen:*

- (1) *We have an inclusion $G \subset G^+(X)$, where G is the Tannakian dual of F .*
- (2) *X is an affine homogeneous space, $X = X_{G,I}$, over this quantum group G .*

PROOF. In the context of Definition 6.28, the tensor category F there gives rise, by the Tannakian duality of Woronowicz [100], to a quantum group $G \subset U_N^+$. What is left is to construct the affine space morphisms α, Φ , and the proof here goes as follows:

- (1) Construction of α . We want to construct a morphism, as follows:

$$\alpha : C(X) \rightarrow C(G) \quad , \quad x_i \rightarrow X_i = \frac{1}{\sqrt{|I|}} \sum_{j \in I} u_{ij}$$

In view of Definition 6.28, we must therefore prove that we have:

$$\sum_{i_1 \dots i_l} \sum_{j_1 \dots j_k} T_{i_1 \dots i_l, j_1 \dots j_k} X_{i_1}^{e_1} \dots X_{i_l}^{e_l} (X_{j_1}^{f_1} \dots X_{j_k}^{f_k})^* = \frac{1}{\sqrt{|I|^{k+l}}} \sum_{b_1 \dots b_l \in I} \sum_{c_1 \dots c_k \in I} T_{b_1 \dots b_l, c_1 \dots c_k}$$

By replacing the variables X_i by their above values, we want to prove that:

$$\sum_{i_1 \dots i_l} \sum_{j_1 \dots j_k} \sum_{r_1 \dots r_l \in I} \sum_{s_1 \dots s_k \in I} T_{i_1 \dots i_l, j_1 \dots j_k} u_{i_1 r_1}^{e_1} \dots u_{i_l r_l}^{e_l} (u_{j_1 s_1}^{f_1} \dots u_{j_k s_k}^{f_k})^* = \sum_{b_1 \dots b_l \in I} \sum_{c_1 \dots c_k \in I} T_{b_1 \dots b_l, c_1 \dots c_k}$$

Now observe that from the relation $T \in \text{Hom}(u^{\otimes k}, u^{\otimes l})$ we obtain:

$$\sum_{i_1 \dots i_l} \sum_{j_1 \dots j_k} T_{i_1 \dots i_l, j_1 \dots j_k} u_{i_1 r_1}^{e_1} \dots u_{i_l r_l}^{e_l} (u_{j_1 s_1}^{f_1} \dots u_{j_k s_k}^{f_k})^* = T_{r_1 \dots r_l, s_1 \dots s_k}$$

Thus, by summing over indices $r_i \in I$ and $s_i \in I$, we obtain the desired formula.

- (2) Construction of Φ . We want to construct a morphism, as follows:

$$\Phi : C(X) \rightarrow C(G) \otimes C(X) \quad , \quad x_i \rightarrow X_i = \sum_j u_{ij} \otimes x_j$$

But this is precisely the coaction map constructed in Proposition 6.29.

(3) Proof of the ergodicity. If we go back to the general theory developed before, we see that the ergodicity condition is equivalent to a number of Tannakian conditions, which are automatic in our case. Thus, the ergodicity condition is automatic. \square

The above result, based on the notion of I -affine manifold, remains quite theoretical. In order to further advance, let us formulate:

DEFINITION 6.31. *Given a submanifold $X \subset S_{\mathbb{C},+}^{N-1}$ and a subset $I \subset \{1, \dots, N\}$, we let $F_{X,I}(k, l) \subset M_{N^l \times N^k}(\mathbb{C})$ be the linear space of linear maps T such that*

$$\sum_{i_1 \dots i_l} \sum_{j_1 \dots j_k} T_{i_1 \dots i_l, j_1 \dots j_k} x_{i_1}^{e_1} \dots x_{i_l}^{e_l} (x_{j_1}^{f_1} \dots x_{j_k}^{f_k})^* = \frac{1}{\sqrt{|I|^{k+l}}} \sum_{b_1 \dots b_l \in I} \sum_{c_1 \dots c_k \in I} T_{b_1 \dots b_l, c_1 \dots c_k}$$

holds over X . We say that X is I -saturated when

$$F_{X,I} = (F_{X,I}(k, l))$$

is a tensor category, and the collection of the above relations presents $C(X)$.

Observe that any I -saturated manifold is automatically I -affine. The known results seem to suggest that the converse of this fact should hold. We do not have a proof of this fact, but we would like to present a few observations on this subject. First, we have:

PROPOSITION 6.32. *The linear spaces $F_{X,I}(k, l) \subset M_{N^l \times N^k}(\mathbb{C})$ are as follows:*

- (1) *They contain the units.*
- (2) *They are stable by conjugation.*
- (3) *They satisfy the Frobenius duality condition.*

PROOF. All these assertions are elementary, as follows:

(1) Consider indeed the unit map. The associated relation is:

$$\sum_{i_1 \dots i_k} x_{i_1}^{e_1} \dots x_{i_k}^{e_k} (x_{i_1}^{e_1} \dots x_{i_k}^{e_k})^* = 1$$

But this relation holds indeed, due to the defining relations for $S_{\mathbb{C},+}^{N-1}$.

(2) We have indeed the following sequence of equivalences:

$$\begin{aligned} & T^* \in F_{X,I}(l, k) \\ \iff & \sum_{i_1 \dots i_l} \sum_{j_1 \dots j_k} T_{j_1 \dots j_k, i_1 \dots i_l}^* x_{j_1}^{f_1} \dots x_{j_k}^{f_k} (x_{i_1}^{e_1} \dots x_{i_l}^{e_l})^* = \frac{1}{\sqrt{|I|^{k+l}}} \sum_{b_1 \dots b_l \in I} \sum_{c_1 \dots c_k \in I} T_{c_1 \dots c_k, b_1 \dots b_l}^* \\ \iff & \sum_{i_1 \dots i_l} \sum_{j_1 \dots j_k} T_{i_1 \dots i_l, j_1 \dots j_k} x_{i_1}^{e_1} \dots x_{i_l}^{e_l} (x_{j_1}^{f_1} \dots x_{j_k}^{f_k})^* = \frac{1}{\sqrt{|I|^{k+l}}} \sum_{b_1 \dots b_l \in I} \sum_{c_1 \dots c_k \in I} T_{b_1 \dots b_l, c_1 \dots c_k} \\ \iff & T \in F_{X,I}(k, l) \end{aligned}$$

(3) We have indeed a correspondence $T \in F_{X,I}(k, l) \leftrightarrow \xi \in F_{X,I}(\emptyset, l\bar{k})$, given by the usual formulae for the Frobenius isomorphism. \square

Based on the above result, we can now formulate our observations, as follows:

THEOREM 6.33. *Given a closed subgroup $G \subset U_N^+$, and an index set $I \subset \{1, \dots, N\}$, consider the corresponding affine homogeneous space $X_{G,I} \subset S_{\mathbb{C},+}^{N-1}$.*

- (1) $X_{G,I}$ is I -saturated precisely when the collection of spaces $F_{X,I} = (F_{X,I}(k, l))$ is stable under compositions, and under tensor products.
- (2) We have $F_{X,I} = F$ precisely when we have

$$\begin{aligned} & \sum_{j_1 \dots j_l \in I} \left(\sum_{i_1 \dots i_l} \xi_{i_1 \dots i_l} u_{i_1 j_1}^{e_1} \dots u_{i_l j_l}^{e_l} - \xi_{j_1 \dots j_l} \right) = 0 \\ \implies & \sum_{i_1 \dots i_l} \xi_{i_1 \dots i_l} u_{i_1 j_1}^{e_1} \dots u_{i_l j_l}^{e_l} - \xi_{j_1 \dots j_l} = 0 \end{aligned}$$

for any choice of the indices j_1, \dots, j_l .

PROOF. We use the fact, from Theorem 6.27, that with $F(k, l) = \text{Hom}(u^{\otimes k}, u^{\otimes l})$, we have inclusions of vector spaces $F(k, l) \subset F_{X,I}(k, l)$. Moreover, once again by Theorem 6.27, the relations coming from the elements of the category formed by the spaces $F(k, l)$ present $X_{G,I}$. Thus, the relations coming from the elements of $F_{X,I}$ present $X_{G,I}$ as well. With this observation in hand, our assertions follow from Proposition 6.32:

(1) According to Proposition 6.32 (1,2) the unit and conjugation axioms are satisfied, so the spaces $F_{X,I}(k, l)$ form a tensor category precisely when the remaining axioms, namely the composition and the tensor product one, are satisfied. Now by assuming that these two axioms are satisfied, X follows to be I -saturated, by the above observation.

(2) Since we already have inclusions in one sense, the equality $F_{X,I} = F$ from the statement means that we must have inclusions in the other sense, as follows:

$$F_{X,I}(k, l) \subset F(k, l)$$

By using now Proposition 6.32 (3), it is enough to discuss the case $k = 0$. And here, assuming that we have $\xi \in F_{X,I}(0, l)$, the following condition must be satisfied:

$$\sum_{i_1 \dots i_l} \xi_{i_1 \dots i_l} x_{i_1}^{e_1} \dots x_{i_l}^{e_l} = \sum_{j_1 \dots j_l \in I} \xi_{j_1 \dots j_l}$$

By applying now the morphism $\alpha : C(X_{G,I}) \rightarrow C(G)$, we deduce that we have:

$$\sum_{i_1 \dots i_l} \xi_{i_1 \dots i_l} \sum_{j_1 \dots j_l \in I} u_{i_1 j_1}^{e_1} \dots u_{i_l j_l}^{e_l} = \sum_{j_1 \dots j_l \in I} \xi_{j_1 \dots j_l}$$

Now recall that $F(0, l) = \text{Fix}(u^{\otimes l})$ consists of the vectors ξ satisfying:

$$\sum_{i_1 \dots i_l} \xi_{i_1 \dots i_l} u_{i_1 j_1}^{e_1} \dots u_{i_l j_l}^{e_l} = \xi_{j_1 \dots j_l}, \forall j_1, \dots, j_l$$

We are therefore led to the conclusion in the statement. \square

CHAPTER 7

Projective freeness

7a. Projective spaces

This chapter is an introduction to projective geometry, in our sense. As a first topic that we would like to discuss, we have the following remarkable isomorphism:

$$PO_N^+ = PU_N^+$$

In order to get started, let us first discuss the classical case. We have here:

THEOREM 7.1. *The passage $O_N \rightarrow U_N$ appears via Lie algebra complexification,*

$$O_N \rightarrow \mathfrak{o}_N \rightarrow \mathfrak{u}_n \rightarrow U_N$$

with the Lie algebra \mathfrak{u}_N being a complexification of the Lie algebra \mathfrak{o}_N .

PROOF. This is something rather philosophical, and advanced as well, that we will not really need here, the idea being as follows:

(1) The unitary and orthogonal groups U_N, O_N are both Lie groups, in the sense that they are smooth manifolds. The corresponding Lie algebras $\mathfrak{u}_N, \mathfrak{o}_N$, which are by definition the respective tangent spaces at 1, can be computed by differentiating the equations defining U_N, O_N , with the conclusion being as follows:

$$\mathfrak{u}_N = \left\{ A \in M_N(\mathbb{C}) \mid A^* = -A \right\}$$

$$\mathfrak{o}_N = \left\{ B \in M_N(\mathbb{R}) \mid B^t = -B \right\}$$

(2) This was for the correspondences $U_N \rightarrow \mathfrak{u}_N$ and $O_N \rightarrow \mathfrak{o}_N$. In the other sense, the correspondences $\mathfrak{u}_N \rightarrow U_N$ and $\mathfrak{o}_N \rightarrow O_N$ appear by exponentiation, the result here stating that, around 1, the unitary matrices can be written as $U = e^A$, with $A \in \mathfrak{u}_N$, and the orthogonal matrices can be written as $U = e^B$, with $B \in \mathfrak{o}_N$.

(3) In view of all this, in order to understand the passage $O_N \rightarrow U_N$ it is enough to understand the passage $\mathfrak{o}_N \rightarrow \mathfrak{u}_N$. But, in view of the above formulae for $\mathfrak{o}_N, \mathfrak{u}_N$, this is basically an elementary linear algebra problem. Indeed, let us pick an arbitrary matrix $A \in M_N(\mathbb{C})$, and write it as follows, with $B, C \in M_N(\mathbb{R})$:

$$A = B + iC$$

In terms of B, C , the equation $A^* = -A$ defining the Lie algebra \mathfrak{u}_N reads:

$$B^t = -B \quad , \quad C^t = C$$

(4) As a first observation, we must have $B \in \mathfrak{o}_N$. Regarding now C , let us decompose this matrix as follows, with D being its diagonal, and C' being the reminder:

$$C = D + C'$$

The matrix C' being symmetric with 0 on the diagonal, by swithcing all the signs below the main diagonal we obtain a certain matrix $C'_- \in \mathfrak{o}_N$. Thus, we have decomposed $A \in \mathfrak{u}_N$ as follows, with $B, C'_- \in \mathfrak{o}_N$, and with $D \in M_N(\mathbb{R})$ being diagonal:

$$A = B + iD + iC'_-$$

(5) As a conclusion now, we have shown that we have a direct sum decomposition of real linear spaces as follows, with $\Delta \subset M_N(\mathbb{R})$ being the diagonal matrices:

$$\mathfrak{u}_N \simeq \mathfrak{o}_N \oplus \Delta \oplus \mathfrak{o}_N$$

Thus, we can stop our study here, and say that we have reached the conclusion in the statement, namely that \mathfrak{u}_N appears as a “complexification” of \mathfrak{o}_N . \square

In the free case now, the situation is much simpler, and we have:

THEOREM 7.2. *The passage $O_N^+ \rightarrow U_N^+$ appears via free complexification,*

$$U_N^+ = \widetilde{O}_N^+$$

where the free complexification of a pair (G, u) is the pair $(\widetilde{G}, \widetilde{u})$ with

$$C(\widetilde{G}) = \langle zu_{ij} \rangle \subset C(\mathbb{T}) * C(G) \quad , \quad \widetilde{u} = zu$$

where $z \in C(\mathbb{T})$ is the standard generator, given by $x \rightarrow x$ for any $x \in \mathbb{T}$.

PROOF. We have embeddings as follows, with the first one coming by using the counit, and with the second one coming from the universality property of U_N^+ :

$$O_N^+ \subset \widetilde{O}_N^+ \subset U_N^+$$

We must prove that the embedding on the right is an isomorphism, and there are several ways of doing this, all instructive, as follows:

(1) If we denote by v, u the fundamental corepresentations of O_N^+, U_N^+ , we have:

$$Fix(v^{\otimes k}) = span \left(\xi_\pi \mid \pi \in NC_2(k) \right)$$

$$Fix(u^{\otimes k}) = span \left(\xi_\pi \mid \pi \in \mathcal{NC}_2(k) \right)$$

Moreover, the above vectors ξ_π are known to be linearly independent at $N \geq 2$, and so the above results provide us with bases, and we obtain:

$$\dim(Fix(v^{\otimes k})) = |NC_2(k)| \quad , \quad \dim(Fix(u^{\otimes k})) = |\mathcal{NC}_2(k)|$$

Now since integrating the character of a corepresentation amounts in counting the fixed points, the above two formulae can be rewritten as follows:

$$\int_{O_N^+} \chi_v^k = |NC_2(k)| \quad , \quad \int_{U_N^+} \chi_u^k = |\mathcal{NC}_2(k)|$$

But this shows, via standard free probability theory, that χ_v must follow the Winger semicircle law γ_1 , and that χ_u must follow the Voiculescu circular law Γ_1 :

$$\chi_v \sim \gamma_1 \quad , \quad \chi_u \sim \Gamma_1$$

On the other hand, by [87], when freely multiplying a semicircular variable by a Haar unitary we obtain a circular variable. Thus, the main character of \widetilde{O}_N^+ is circular:

$$\chi_{zv} \sim \Gamma_1$$

Now by forgetting about circular variables and free probability, the conclusion is that the inclusion $\widetilde{O}_N^+ \subset U_N^+$ preserves the law of the main character:

$$law(\chi_{zv}) = law(u)$$

Thus by Peter-Weyl we obtain that the inclusion $\widetilde{O}_N^+ \subset U_N^+$ must be an isomorphism, modulo the usual equivalence relation for quantum groups.

(2) A version of the above proof, not using any prior free probability knowledge, makes use of the easiness property of O_N^+, U_N^+ only, namely:

$$Hom(v^{\otimes k}, v^{\otimes l}) = span \left(\xi_\pi \mid \pi \in NC_2(k, l) \right)$$

$$Hom(u^{\otimes k}, u^{\otimes l}) = span \left(\xi_\pi \mid \pi \in \mathcal{NC}_2(k, l) \right)$$

Indeed, let us look at the following inclusions of quantum groups:

$$O_N^+ \subset \widetilde{O}_N^+ \subset U_N^+$$

At the level of the associated Hom spaces we obtain reverse inclusions, as follows:

$$Hom(v^{\otimes k}, v^{\otimes l}) \supset Hom((zv)^{\otimes k}, (zv)^{\otimes l}) \supset Hom(u^{\otimes k}, u^{\otimes l})$$

The spaces on the left and on the right are known from easiness, the result being that these spaces are as follows:

$$span \left(T_\pi \mid \pi \in NC_2(k, l) \right) \supset span \left(T_\pi \mid \pi \in \mathcal{NC}_2(k, l) \right)$$

Regarding the spaces in the middle, these are obtained from those on the left by ‘‘coloring’’, so we obtain the same spaces as those on the right. Thus, by Tannakian duality, our embedding $\widetilde{O}_N^+ \subset U_N^+$ is an isomorphism, modulo the usual equivalence relation. \square

As an interesting consequence of the above result, we have:

THEOREM 7.3. *We have an identification as follows,*

$$PO_N^+ = PU_N^+$$

modulo the usual equivalence relation for compact quantum groups.

PROOF. As before, we have several proofs for this result, as follows:

(1) This follows from Theorem 7.2, because we have:

$$PU_N^+ = \widetilde{PO}_N^+ = PO_N^+$$

(2) We can deduce this as well directly. With notations as before, we have:

$$\text{Hom}((v \otimes v)^k, (v \otimes v)^l) = \text{span} \left(T_\pi \Big| \pi \in \mathcal{NC}_2((\bullet\bullet)^k, (\bullet\bullet)^l) \right)$$

$$\text{Hom}((u \otimes \bar{u})^k, (u \otimes \bar{u})^l) = \text{span} \left(T_\pi \Big| \pi \in \mathcal{NC}_2((\bullet\bullet)^k, (\bullet\bullet)^l) \right)$$

The sets on the right being equal, we conclude that the inclusion $PO_N^+ \subset PU_N^+$ preserves the corresponding Tannakian categories, and so must be an isomorphism. \square

As a conclusion, the passage $O_N^+ \rightarrow U_N^+$ is something much simpler than the passage $O_N \rightarrow U_N$, with this ultimately coming from the fact that the combinatorics of O_N^+, U_N^+ is something much simpler than the combinatorics of O_N, U_N . In addition, all this leads as well to the interesting conclusion that the free projective geometry does not fall into real and complex, but is rather unique and “scalarless”. We will be back to this.

Let us discuss now the projective spaces. We first have:

PROPOSITION 7.4. *We have presentation results as follows,*

$$\begin{aligned} C(P_{\mathbb{R}}^{N-1}) &= C_{\text{comm}}^* \left((p_{ij})_{i,j=1,\dots,N} \Big| p = \bar{p} = p^t = p^2, \text{Tr}(p) = 1 \right) \\ C(P_{\mathbb{C}}^{N-1}) &= C_{\text{comm}}^* \left((p_{ij})_{i,j=1,\dots,N} \Big| p = p^* = p^2, \text{Tr}(p) = 1 \right) \end{aligned}$$

for the algebras of continuous functions on the real and complex projective spaces.

PROOF. We use the fact that the projective spaces $P_{\mathbb{R}}^{N-1}, P_{\mathbb{C}}^{N-1}$ can be respectively identified with the spaces of rank one projections in $M_N(\mathbb{R}), M_N(\mathbb{C})$. With this picture in mind, it is clear that we have arrows \leftarrow . In order to construct now arrows \rightarrow , consider the universal algebras on the right, A_R, A_C . These algebras being both commutative, by the Gelfand theorem we can write, with X_R, X_C being certain compact spaces:

$$A_R = C(X_R) \quad , \quad A_C = C(X_C)$$

Now by using the coordinate functions p_{ij} , we conclude that X_R, X_C are certain spaces of rank one projections in $M_N(\mathbb{R}), M_N(\mathbb{C})$. In other words, we have embeddings:

$$X_R \subset P_{\mathbb{R}}^{N-1} \quad , \quad X_C \subset P_{\mathbb{C}}^{N-1}$$

By transposing we obtain arrows \rightarrow , as desired. \square

The above result suggests the following definition:

DEFINITION 7.5. *Associated to any $N \in \mathbb{N}$ is the following universal algebra,*

$$C(P_+^{N-1}) = C^* \left((p_{ij})_{i,j=1,\dots,N} \mid p = p^* = p^2, \text{Tr}(p) = 1 \right)$$

whose abstract spectrum is called “free projective space”.

Observe that, according to our presentation results for the real and complex projective spaces $P_{\mathbb{R}}^{N-1}$ and $P_{\mathbb{C}}^{N-1}$, we have embeddings of compact quantum spaces, as follows:

$$P_{\mathbb{R}}^{N-1} \subset P_{\mathbb{C}}^{N-1} \subset P_+^{N-1}$$

Let us first discuss the relation with the spheres. Given a closed subset $X \subset S_{\mathbb{R},+}^{N-1}$, its projective version is by definition the quotient space $X \rightarrow PX$ determined by the fact that $C(PX) \subset C(X)$ is the subalgebra generated by the following variables:

$$p_{ij} = x_i x_j$$

In order to discuss the relation with the spheres, it is convenient to neglect the material regarding the complex and hybrid cases, the projective versions of such spheres bringing nothing new. Thus, we are left with the 3 real spheres, and we have:

PROPOSITION 7.6. *The projective versions of the 3 real spheres are as follows,*

$$\begin{array}{ccccc} S_{\mathbb{R}}^{N-1} & \longrightarrow & S_{\mathbb{R},*}^{N-1} & \longrightarrow & S_{\mathbb{R},+}^{N-1} \\ \downarrow & & \downarrow & & \downarrow \\ P_{\mathbb{R}}^{N-1} & \longrightarrow & P_{\mathbb{C}}^{N-1} & \longrightarrow & P_+^{N-1} \end{array}$$

modulo the standard equivalence relation for the quantum algebraic manifolds.

PROOF. The assertion at left is true by definition. For the assertion at right, we have to prove that the variables $p_{ij} = z_i z_j$ over the free sphere $S_{\mathbb{R},+}^{N-1}$ satisfy the defining relations for $C(P_+^{N-1})$, from Definition 7.5, namely:

$$p = p^* = p^2 \quad , \quad \text{Tr}(p) = 1$$

We first have the following computation:

$$(p^*)_{ij} = p_{ji}^* = (z_j z_i)^* = z_i z_j = p_{ij}$$

We have as well the following computation:

$$(p^2)_{ij} = \sum_k p_{ik} p_{kj} = \sum_k z_i z_k^2 z_j = z_i z_j = p_{ij}$$

Finally, we have as well the following computation:

$$\text{Tr}(p) = \sum_k p_{kk} = \sum_k z_k^2 = 1$$

Regarding now $PS_{\mathbb{R},*}^{N-1} = P_{\mathbb{C}}^{N-1}$, the inclusion “ \subset ” follows from $abcd = cbad = cbda$. In the other sense now, the point is that we have a matrix model, as follows:

$$\pi : C(S_{\mathbb{R},*}^{N-1}) \rightarrow M_2(C(S_{\mathbb{C}}^{N-1})) \quad , \quad x_i \rightarrow \begin{pmatrix} 0 & z_i \\ \bar{z}_i & 0 \end{pmatrix}$$

But this gives the missing inclusion “ \supset ”, and we are done. See [11]. \square

In addition to the above result, let us mention that, as already discussed above, passing to the complex case brings nothing new. This is because the projective version of the free complex sphere is equal to the free projective space constructed above:

$$PS_{\mathbb{C},+}^{N-1} = P_+^{N-1}$$

And the same goes for the “hybrid” spheres. For details on all this, we refer to chapters 5-6. In what regards now the tori, we have here the following result:

PROPOSITION 7.7. *The projective versions of the 3 real tori are as follows,*

$$\begin{array}{ccccc} T_N & \longrightarrow & T_N^* & \longrightarrow & T_N^+ \\ \downarrow & & \downarrow & & \downarrow \\ PT_N & \longrightarrow & P\mathbb{T}_N & \longrightarrow & PT_N^+ \end{array}$$

modulo the standard equivalence relation for the quantum algebraic manifolds.

PROOF. This follows indeed by using the same arguments as for the spheres. \square

In what regards the orthogonal groups, we have here the following result:

PROPOSITION 7.8. *The projective versions of the 3 orthogonal groups are*

$$\begin{array}{ccccc} O_N & \longrightarrow & O_N^* & \longrightarrow & O_N^+ \\ \downarrow & & \downarrow & & \downarrow \\ PO_N & \longrightarrow & PU_N & \longrightarrow & PO_N^+ \end{array}$$

modulo the standard equivalence relation for the compact quantum groups.

PROOF. This follows by using the same arguments as for spheres, or tori. \square

Finally, in what regards the reflection groups, we have here the following result:

PROPOSITION 7.9. *The projective versions of the 3 reflection groups are*

$$\begin{array}{ccccc}
 H_N & \longrightarrow & H_N^* & \longrightarrow & H_N^+ \\
 \downarrow & & \downarrow & & \downarrow \\
 PH_N & \longrightarrow & PK_N & \longrightarrow & PH_N^+
 \end{array}$$

modulo the standard equivalence relation for the compact quantum groups.

PROOF. This follows indeed by using the same arguments as before. \square

As a conclusion to this, in the projective geometry setting, we have 3 projective quadruplets, whose construction and main properties can be summarized as follows:

THEOREM 7.10. *We have projective quadruplets (P, PT, PU, PK) as follows,*

(1) *A classical real quadruplet, as follows,*

$$\begin{array}{ccc}
 P_{\mathbb{R}}^{N-1} & \text{---} & PT_N \\
 \downarrow & \diagdown & \downarrow \\
 & & \\
 \downarrow & \diagup & \downarrow \\
 PO_N & \text{---} & PH_N
 \end{array}$$

(2) *A classical complex quadruplet, as follows,*

$$\begin{array}{ccc}
 P_{\mathbb{C}}^{N-1} & \text{---} & PT_N \\
 \downarrow & \diagdown & \downarrow \\
 & & \\
 \downarrow & \diagup & \downarrow \\
 PU_N & \text{---} & PK_N
 \end{array}$$

(3) *A free quadruplet, as follows,*

$$\begin{array}{ccc}
 P_+^{N-1} & \text{---} & PT_N^+ \\
 \downarrow & \diagdown & \downarrow \\
 & & \\
 \downarrow & \diagup & \downarrow \\
 PO_N^+ & \text{---} & PH_N^+
 \end{array}$$

which appear as projective versions of the main 3 real quadruplets.

PROOF. This follows indeed from the results that already have. To be more precise, the details, that we will need in what comes next, are as follows:

- (1) Consider the classical affine real quadruplet, which is as follows:

$$\begin{array}{ccc}
 S_{\mathbb{R}}^{N-1} & \text{---} & T_N \\
 | & \diagdown & / \\
 O_N & \text{---} & H_N
 \end{array}$$

The projective version of this quadruplet is then the quadruplet in (1).

- (2) Consider the half-classical affine real quadruplet, which is as follows:

$$\begin{array}{ccc}
 S_{\mathbb{R},*}^{N-1} & \text{---} & T_N^* \\
 | & \diagdown & / \\
 O_N^* & \text{---} & H_N^*
 \end{array}$$

The projective version of this quadruplet is then the quadruplet in (2).

- (3) Consider the free affine real quadruplet, which is as follows:

$$\begin{array}{ccc}
 S_{\mathbb{R},+}^{N-1} & \text{---} & T_N^+ \\
 | & \diagdown & / \\
 O_N^+ & \text{---} & H_N^+
 \end{array}$$

The projective version of this quadruplet is then the quadruplet in (3). \square

7b. The threefold way

Getting back now to our general projective geometry program, we would like to have axiomatization and classification results for such quadruplets. In order to do this, following [12], we can axiomatize our various projective spaces, as follows:

DEFINITION 7.11. *A monomial projective space is a closed subset $P \subset P_+^{N-1}$ obtained via relations of type*

$$p_{i_1 i_2} \cdots p_{i_{k-1} i_k} = p_{i_{\sigma(1)} i_{\sigma(2)}} \cdots p_{i_{\sigma(k-1)} i_{\sigma(k)}}, \quad \forall (i_1, \dots, i_k) \in \{1, \dots, N\}^k$$

with σ ranging over a certain subset of $\bigcup_{k \in 2\mathbb{N}} S_k$, which is stable under $\sigma \rightarrow |\sigma|$.

Observe the similarity with the corresponding monomiality notion for the spheres, from before. The only subtlety in the projective case is the stability under the operation $\sigma \rightarrow |\sigma|$, which in practice means that if the above relation associated to σ holds, then the following relation, associated to $|\sigma|$, must hold as well:

$$p_{i_0 i_1} \cdots p_{i_k i_{k+1}} = p_{i_0 i_{\sigma(1)}} p_{i_{\sigma(2)} i_{\sigma(3)}} \cdots p_{i_{\sigma(k-2)} i_{\sigma(k-1)}} p_{i_{\sigma(k)} i_{k+1}}$$

As an illustration, the basic projective spaces are all monomial:

PROPOSITION 7.12. *The 3 projective spaces are all monomial, with the permutations*

producing respectively the spaces $P_{\mathbb{R}}^{N-1}$, $P_{\mathbb{C}}^{N-1}$, and with no relation needed for P_{+}^{N-1} .

PROOF. We must divide the algebra $C(P_{+}^{N-1})$ by the relations associated to the diagrams in the statement, as well as those associated to their shifted versions, given by:

(1) The basic crossing, and its shifted version, produce the following relations:

$$p_{ab} = p_{ba}$$

$$p_{ab} p_{cd} = p_{ac} p_{bd}$$

Now by using these relations several times, we obtain the following formula:

$$p_{ab} p_{cd} = p_{ac} p_{bd} = p_{ca} p_{db} = p_{cd} p_{ab}$$

Thus, the space produced by the basic crossing is classical, $P \subset P_{\mathbb{C}}^{N-1}$. By using one more time the relations $p_{ab} = p_{ba}$ we conclude that we have $P = P_{\mathbb{R}}^{N-1}$, as claimed.

(2) The fattened crossing, and its shifted version, produce the following relations:

$$p_{ab} p_{cd} = p_{cd} p_{ab}$$

$$p_{ab} p_{cd} p_{ef} = p_{ad} p_{eb} p_{cf}$$

The first relations tell us that the projective space must be classical, $P \subset P_{\mathbb{C}}^{N-1}$. Now observe that with $p_{ij} = z_i \bar{z}_j$, the second relations read:

$$z_a \bar{z}_b z_c \bar{z}_d z_e \bar{z}_f = z_a \bar{z}_d z_e \bar{z}_b z_c \bar{z}_f$$

Since these relations are automatic, we have $P = P_{\mathbb{C}}^{N-1}$, and we are done. \square

Following [12], we can now formulate our classification result, as follows:

THEOREM 7.13. *The basic projective spaces, namely*

$$P_{\mathbb{R}}^{N-1} \subset P_{\mathbb{C}}^{N-1} \subset P_+^{N-1}$$

are the only monomial ones.

PROOF. We follow the proof from the affine case. Let \mathcal{R}_σ be the collection of relations associated to a permutation $\sigma \in S_k$ with $k \in 2\mathbb{N}$, as in Definition 7.11. We fix a monomial projective space $P \subset P_+^{N-1}$, and we associate to it subsets $G_k \subset S_k$, as follows:

$$G_k = \begin{cases} \{\sigma \in S_k \mid \mathcal{R}_\sigma \text{ hold over } P\} & (k \text{ even}) \\ \{\sigma \in S_k \mid \mathcal{R}_{|\sigma} \text{ hold over } P\} & (k \text{ odd}) \end{cases}$$

As in the affine case, we obtain in this way a filtered group $G = (G_k)$, which is stable under removing outer strings, and under removing neighboring strings. Thus the computations in chapter 13 apply, and show that we have only 3 possible situations, corresponding to the 3 projective spaces in Proposition 7.12. \square

Let us discuss now similar results for the projective quantum groups. Given a closed subgroup $G \subset O_N^+$, its projective version $G \rightarrow PG$ is by definition given by the fact that $C(PG) \subset C(G)$ is the subalgebra generated by the following variables:

$$w_{ij,ab} = u_{ia}u_{jb}$$

In the classical case we recover in this way the usual projective version:

$$PG = G/(G \cap \mathbb{Z}_2^N)$$

We have the following key result:

THEOREM 7.14. *The quantum group O_N^* is the unique intermediate easy quantum group $O_N \subset G \subset O_N^+$. Moreover, in the non-easy case, the following happen:*

- (1) *The group inclusion $\mathbb{T}O_N \subset U_N$ is maximal.*
- (2) *The group inclusion $PO_N \subset PU_N$ is maximal.*
- (3) *The quantum group inclusion $O_N \subset O_N^*$ is maximal.*

PROOF. This is something that we discussed before, the idea being that the first assertion comes by classifying the categories of pairings, and then:

- (1) This can be obtained by using standard Lie group methods.
- (2) This follows from (1), by taking projective versions.
- (3) This follows from (2), via standard algebraic lifting results. \square

Our claim now is that, under suitable assumptions, PU_N is the only intermediate object $PO_N \subset G \subset PO_N^+$. In order to formulate a precise statement here, we first recall the following notion, that we have already heavily used in this book:

DEFINITION 7.15. A collection of sets $D = \bigsqcup_{k,l} D(k,l)$ with

$$D(k,l) \subset P(k,l)$$

is called a category of partitions when it has the following properties:

- (1) Stability under the horizontal concatenation, $(\pi, \sigma) \rightarrow [\pi\sigma]$.
- (2) Stability under vertical concatenation $(\pi, \sigma) \rightarrow \begin{bmatrix} \sigma \\ \pi \end{bmatrix}$, with matching middle symbols.
- (3) Stability under the upside-down turning $*$, with switching of colors, $\circ \leftrightarrow \bullet$.
- (4) Each set $P(k,k)$ contains the identity partition $|| \dots ||$.
- (5) The sets $P(\emptyset, \circ\bullet)$ and $P(\emptyset, \bullet\circ)$ both contain the semicircle \cap .

The above definition is something inspired from the axioms of Tannakian categories, and going hand in hand with it is the following definition:

DEFINITION 7.16. An intermediate compact quantum group

$$O_N \subset G \subset O_N^+$$

is called easy when the corresponding Tannakian category

$$\text{span}(NC_2(k,l)) \subset \text{Hom}(u^{\otimes k}, u^{\otimes l}) \subset \text{span}(P_2(k,l))$$

comes via the following formula, using the standard $\pi \rightarrow T_\pi$ construction,

$$\text{Hom}(u^{\otimes k}, u^{\otimes l}) = \text{span}(D(k,l))$$

from a certain collection of sets of pairings $D = (D(k,l))$.

As a key remark here, by “saturating” the sets $D(k,l)$, we can assume that the collection $D = (D(k,l))$ is a category of pairings, in the sense that it is stable under vertical and horizontal concatenation, upside-down turning, and contains the semicircle.

In the projective case now, following [12], let us formulate:

DEFINITION 7.17. A projective category of pairings is a collection of subsets

$$NC_2(2k, 2l) \subset E(k, l) \subset P_2(2k, 2l)$$

stable under the usual categorical operations, and satisfying $\sigma \in E \implies |\sigma| \in E$.

As basic examples here, we have the following projective categories of pairings, where P_2^* is the category of matching pairings:

$$NC_2 \subset P_2^* \subset P_2$$

This follows indeed from definitions. Now with the above notion in hand, we can formulate the following projective analogue of the notion of easiness:

DEFINITION 7.18. *An intermediate compact quantum group*

$$PO_N \subset H \subset PO_N^+$$

is called projectively easy when its Tannakian category

$$\text{span}(NC_2(2k, 2l)) \subset \text{Hom}(v^{\otimes k}, v^{\otimes l}) \subset \text{span}(P_2(2k, 2l))$$

comes via via the following formula, using the standard $\pi \rightarrow T_\pi$ construction,

$$\text{Hom}(v^{\otimes k}, v^{\otimes l}) = \text{span}(E(k, l))$$

for a certain projective category of pairings $E = (E(k, l))$.

Thus, we have a projective notion of easiness. Observe that, given an easy quantum group $O_N \subset G \subset O_N^+$, its projective version $PO_N \subset PG \subset PO_N^+$ is projectively easy in our sense. In particular the basic projective quantum groups $PO_N \subset PU_N \subset PO_N^+$ are all projectively easy in our sense, coming from the categories $NC_2 \subset P_2^* \subset P_2$.

We have in fact the following general result, from [12]:

THEOREM 7.19. *We have a bijective correspondence between the affine and projective categories of partitions, given by the operation*

$$G \rightarrow PG$$

at the level of the corresponding affine and projective easy quantum groups.

PROOF. The construction of correspondence $D \rightarrow E$ is clear, simply by setting:

$$E(k, l) = D(2k, 2l)$$

Indeed, due to the axioms in Definition 7.15, the conditions in Definition 7.17 are satisfied. Conversely, given $E = (E(k, l))$ as in Definition 7.17, we can set:

$$D(k, l) = \begin{cases} E(k, l) & (k, l \text{ even}) \\ \{\sigma : |\sigma \in E(k+1, l+1)\} & (k, l \text{ odd}) \end{cases}$$

Our claim is that $D = (D(k, l))$ is a category of partitions. Indeed:

(1) The composition action is clear. Indeed, when looking at the numbers of legs involved, in the even case this is clear, and in the odd case, this follows from:

$$\begin{aligned} |\sigma, |\sigma' \in E &\implies \begin{matrix} \sigma \\ \tau \end{matrix} \in E \\ &\implies \begin{matrix} \sigma \\ \tau \end{matrix} \in D \end{aligned}$$

(2) For the tensor product axiom, we have 4 cases to be investigated, depending on the parity of the number of legs of σ, τ , as follows:

– The even/even case is clear.

– The odd/even case follows from the following computation:

$$\begin{aligned} |\sigma, \tau \in E &\implies |\sigma\tau \in E \\ &\implies \sigma\tau \in D \end{aligned}$$

– Regarding now the even/odd case, this can be solved as follows:

$$\begin{aligned} \sigma, |\tau \in E &\implies |\sigma|, |\tau \in E \\ &\implies |\sigma||\tau \in E \\ &\implies |\sigma\tau \in E \\ &\implies \sigma\tau \in D \end{aligned}$$

– As for the remaining odd/odd case, here the computation is as follows:

$$\begin{aligned} |\sigma, |\tau \in E &\implies ||\sigma|, |\tau \in E \\ &\implies ||\sigma||\tau \in E \\ &\implies \sigma\tau \in E \\ &\implies \sigma\tau \in D \end{aligned}$$

(3) Finally, the conjugation axiom is clear from definitions. It is also clear that both compositions $D \rightarrow E \rightarrow D$ and $E \rightarrow D \rightarrow E$ are the identities, as claimed. As for the quantum group assertion, this is clear as well from definitions. \square

Now back to uniqueness issues, we have here the following result, also from [12]:

THEOREM 7.20. *We have the following results:*

(1) O_N^* is the only intermediate easy quantum group, as follows:

$$O_N \subset G \subset O_N^+$$

(2) PU_N is the only intermediate projectively easy quantum group, as follows:

$$PO_N \subset G \subset PO_N^+$$

PROOF. The idea here is as follows:

(1) The assertion regarding $O_N \subset O_N^* \subset O_N^+$ is well-known, and this is something that we already know, explained in the above.

(2) The assertion regarding $PO_N \subset PU_N \subset PO_N^+$ follows from the classification result in (1), and from the duality in Theorem 7.19. \square

Summarizing, we have analogues of the various affine classification results, with the remark that everything becomes simpler in the projective setting.

7c. Projective geometry

We have so far projective analogues of the various affine classification results. In view of this, our next goal will be that of finding projective versions of the quantum isometry group results that we have in the affine setting. We use the following action formalism, which is quite similar to the affine action formalism introduced in chapter 2:

DEFINITION 7.21. *Consider a closed subgroup of the free orthogonal group, $G \subset O_N^+$, and a closed subset of the free real sphere, $X \subset S_{\mathbb{R},+}^{N-1}$.*

(1) *We write $G \curvearrowright X$ when we have a morphism of C^* -algebras, as follows:*

$$\Phi : C(X) \rightarrow C(X) \otimes C(G)$$

$$\Phi(z_i) = \sum_a z_a \otimes u_{ai}$$

(2) *We write $PG \curvearrowright PX$ when we have a morphism of C^* -algebras, as follows:*

$$\Phi : C(PX) \rightarrow C(PX) \otimes C(PG)$$

$$\Phi(z_i z_j) = \sum_a z_a z_b \otimes u_{ai} u_{bj}$$

Observe that the above morphisms Φ , if they exist, are automatically coaction maps. Observe also that an affine action $G \curvearrowright X$ produces a projective action $PG \curvearrowright PX$. Let us also mention that given an algebraic subset $X \subset S_{\mathbb{R},+}^{N-1}$, it is routine to prove that there exist indeed universal quantum groups $G \subset O_N^+$ acting as (1), and as in (2). We have the following result, from [11] and related papers, with respect to the above notions:

THEOREM 7.22. *The quantum isometry groups of basic spheres and projective spaces,*

$$\begin{array}{ccccc} S_{\mathbb{R}}^{N-1} & \longrightarrow & S_{\mathbb{R},*}^{N-1} & \longrightarrow & S_{\mathbb{R},+}^{N-1} \\ \downarrow & & \downarrow & & \downarrow \\ P_{\mathbb{R}}^{N-1} & \longrightarrow & P_{\mathbb{C}}^{N-1} & \longrightarrow & P_+^{N-1} \end{array}$$

are the following affine and projective quantum groups,

$$\begin{array}{ccccc} O_N & \longrightarrow & O_N^* & \longrightarrow & O_N^+ \\ \downarrow & & \downarrow & & \downarrow \\ PO_N & \longrightarrow & PU_N & \longrightarrow & PO_N^+ \end{array}$$

with respect to the affine and projective action notions introduced above.

PROOF. The fact that the 3 quantum groups on top act affinely on the corresponding 3 spheres is known since [11], and is elementary, explained before. By restriction, the 3 quantum groups on the bottom follow to act on the corresponding 3 projective spaces. We must prove now that all these actions are universal. At right there is nothing to prove, so we are left with studying the actions on $S_{\mathbb{R}}^{N-1}$, $S_{\mathbb{R},*}^{N-1}$ and on $P_{\mathbb{R}}^{N-1}$, $P_{\mathbb{C}}^{N-1}$.

$P_{\mathbb{R}}^{N-1}$. Consider the following projective coordinates:

$$p_{ij} = z_i z_j \quad , \quad w_{ij,ab} = u_{ai} u_{bj}$$

In terms of these projective coordinates, the coaction map is given by:

$$\Phi(p_{ij}) = \sum_{ab} p_{ab} \otimes w_{ij,ab}$$

Thus, we have the following formulae:

$$\begin{aligned} \Phi(p_{ij}) &= \sum_{a < b} p_{ab} \otimes (w_{ij,ab} + w_{ij,ba}) + \sum_a p_{aa} \otimes w_{ij,aa} \\ \Phi(p_{ji}) &= \sum_{a < b} p_{ab} \otimes (w_{ji,ab} + w_{ji,ba}) + \sum_a p_{aa} \otimes w_{ji,aa} \end{aligned}$$

By comparing these two formulae, and then by using the linear independence of the variables $p_{ab} = z_a z_b$ for $a \leq b$, we conclude that we must have:

$$w_{ij,ab} + w_{ij,ba} = w_{ji,ab} + w_{ji,ba}$$

Let us apply now the antipode to this formula. For this purpose, observe that:

$$\begin{aligned} S(w_{ij,ab}) &= S(u_{ai} u_{bj}) \\ &= S(u_{bj}) S(u_{ai}) \\ &= u_{jb} u_{ia} \\ &= w_{ba,ji} \end{aligned}$$

Thus by applying the antipode we obtain:

$$w_{ba,ji} + w_{ab,ji} = w_{ba,ij} + w_{ab,ij}$$

By relabelling, we obtain the following formula:

$$w_{ji,ba} + w_{ij,ba} = w_{ji,ab} + w_{ij,ab}$$

Now by comparing with the original relation, we obtain:

$$w_{ij,ab} = w_{ji,ba}$$

But, with $w_{ij,ab} = u_{ai} u_{bj}$, this formula reads:

$$u_{ai} u_{bj} = u_{bj} u_{ai}$$

Thus $G \subset O_N$, and it follows that we have $PG \subset PO_N$, as claimed.

$\underline{P_{\mathbb{C}}^{N-1}}$. Consider a coaction map, written as follows, with $p_{ab} = z_a \bar{z}_b$:

$$\Phi(p_{ij}) = \sum_{ab} p_{ab} \otimes u_{ai} u_{bj}$$

The idea here will be that of using the following formula:

$$p_{ab} p_{cd} = p_{ad} p_{cb}$$

We have the following formulae:

$$\begin{aligned} \Phi(p_{ij} p_{kl}) &= \sum_{abcd} p_{ab} p_{cd} \otimes u_{ai} u_{bj} u_{ck} u_{dl} \\ \Phi(p_{il} p_{kj}) &= \sum_{abcd} p_{ad} p_{cb} \otimes u_{ai} u_{dl} u_{ck} u_{bj} \end{aligned}$$

The terms at left being equal, and the last terms at right being equal too, we deduce that, with $[a, b, c] = abc - cba$, we must have the following formula:

$$\sum_{abcd} u_{ai} [u_{bj}, u_{ck}, u_{dl}] \otimes p_{ab} p_{cd} = 0$$

Now since the quantities $p_{ab} p_{cd} = z_a \bar{z}_b z_c \bar{z}_d$ at right depend only on the numbers $|\{a, c\}|, |\{b, d\}| \in \{1, 2\}$, and this dependence produces the only possible linear relations between the variables $p_{ab} p_{cd}$, we are led to $2 \times 2 = 4$ equations, as follows:

- (1) $u_{ai} [u_{bj}, u_{ak}, u_{bl}] = 0, \forall a, b.$
- (2) $u_{ai} [u_{bj}, u_{ak}, u_{dl}] + u_{ai} [u_{dj}, u_{ak}, u_{bl}] = 0, \forall a, \forall b \neq d.$
- (3) $u_{ai} [u_{bj}, u_{ck}, u_{bl}] + u_{ci} [u_{bj}, u_{ak}, u_{bl}] = 0, \forall a \neq c, \forall b.$
- (4) $u_{ai} [u_{bj}, u_{ck}, u_{dl}] + u_{ai} [u_{dj}, u_{ck}, u_{bl}] + u_{ci} [u_{bj}, u_{ak}, u_{dl}] + u_{ci} [u_{dj}, u_{ak}, u_{bl}] = 0, \forall a \neq c, b \neq d.$

We will need in fact only the first two formulae. Since (1) corresponds to (2) at $b = d$, we conclude that (1,2) are equivalent to (2), with no restriction on the indices. By multiplying now this formula to the left by u_{ai} , and then summing over i , we obtain:

$$[u_{bj}, u_{ak}, u_{dl}] + [u_{dj}, u_{ak}, u_{bl}] = 0$$

We use now a standard antipode/relabel trick. By applying the antipode we obtain:

$$[u_{ld}, u_{ka}, u_{jb}] + [u_{lb}, u_{ka}, u_{jd}] = 0$$

By relabeling we obtain the following formula:

$$[u_{dl}, u_{ak}, u_{bj}] + [u_{dj}, u_{ak}, u_{bl}] = 0$$

Now by comparing with the original relation, we obtain:

$$[u_{bj}, u_{ak}, u_{dl}] = [u_{dj}, u_{ak}, u_{bl}] = 0$$

Thus $G \subset O_N^*$, and it follows that we have $PG \subset PU_N$, as desired. \square

The above results can be probably improved. As an example, let us say that a closed subgroup $G \subset U_N^+$ acts projectively on PX when we have a coaction map as follows:

$$\Phi(z_i z_j) = \sum_{ab} z_a z_b \otimes u_{ai} u_{bj}^*$$

The above proof can be adapted, by putting $*$ signs where needed, and Theorem 7.22 still holds, in this setting. However, establishing general universality results, involving arbitrary subgroups $H \subset PO_N^+$, looks like a quite non-trivial question.

Let us discuss now the axiomatization question for the projective quadruplets of type (P, PT, PU, PK) . We recall that we first have a classical real quadruplet, as follows:

We have then a classical complex quadruplet, which can be thought of as well as being a real half-classical quadruplet, which is as follows:

Finally, we have a free quadruplet, which can be thought of as being the same time real and complex, which is as follows:

The question is that of axiomatizing these quadruplets.

To be more precise, in analogy with what happens in the affine case, the problem is that of establishing correspondences as follows:

Modulo this problem, which is for the moment open, things are potentially quite nice, because we seem to have only 3 geometries, namely real, complex and free. Generally speaking, we are led in this way into several questions:

(1) We first need functoriality results for the operations $<$, $>$ and \cap , in relation with taking the projective version, and taking affine lifts, as to deduce most of our 7 axioms, in their obvious projective formulation, from the affine ones.

(2) Then, we need quantum isometry results in the projective setting, for the projective spaces themselves, and for the projective tori, either established ad-hoc, or by using the affine results. For the projective spaces, this was done above.

(3) We need as well some further functoriality results, in order to axiomatize the intermediate objects that we are dealing, the problem here being whether we want to use projective objects, or projective versions, perhaps saturated, of affine objects.

(4) Modulo this, things are quite clear, with the final result being the fact that we have only 3 projective geometries. Technically, the proof should be using the fact that, in the easy setting, $PO_N \subset PU_N \subset PO_N^+$ are the only possible unitary groups.

7d. Small dimensions

We would like to end this chapter with something refreshing, namely a preliminary study of the free analogue of $P_{\mathbb{R}}^2$. We recall that the projective space $P_{\mathbb{R}}^{N-1}$ is the space of lines in \mathbb{R}^N passing through the origin, the basic examples being as follows:

(1) At $N = 2$ each such a line, in \mathbb{R}^2 passing through the origin, corresponds to 2 opposite points on the unit circle $\mathbb{T} \subset \mathbb{R}^2$. Thus, $P_{\mathbb{R}}^1$ corresponds to the upper semicircle of \mathbb{T} , with the endpoints identified, and so we obtain a circle, $P_{\mathbb{R}}^1 = \mathbb{T}$.

(2) At $N = 3$ the situation is similar, with $P_{\mathbb{R}}^2$ corresponding to the upper hemisphere of the sphere $S_{\mathbb{R}}^2 \subset \mathbb{R}^3$, with the points on the equator identified via $x = -x$. Topologically speaking, we can deform if we want the upper hemisphere into a square, with the equator becoming the boundary of this square, and in this picture, the $x = -x$ identification

corresponds to the “identify opposite edges, with opposite orientations” folding method for the square, leading to a space $P_{\mathbb{R}}^2$ which is obviously not embeddable into \mathbb{R}^3 .

We recall that the free projective space is defined by the following formula:

$$C(P_+^{N-1}) = C^* \left((p_{ij})_{i,j=1,\dots,N} \mid p = p^* = p^2, \text{Tr}(p) = 1 \right)$$

Let us first discuss, as a warm-up, the 2D case. Here the above matrix of projective coordinates is as follows, with $a = a^*$, $b = b^*$, $a + b = 1$:

$$p = \begin{pmatrix} a & c \\ c^* & b \end{pmatrix}$$

We have the following computation:

$$p^2 = \begin{pmatrix} a & c \\ c^* & b \end{pmatrix} \begin{pmatrix} a & c \\ c^* & b \end{pmatrix} = \begin{pmatrix} a^2 + cc^* & ac + cb \\ c^*a + bc^* & c^*c + b^2 \end{pmatrix}$$

Thus, the equations to be satisfied are as follows:

$$a^2 + cc^* = a$$

$$b^2 + c^*c = b$$

$$ac + cb = c$$

$$c^*a + bc^* = c^*$$

The 4th equation is the conjugate of the 3rd equation, so we remove it. By using $a + b = 1$, the remaining equations can be written as:

$$cc^* = c^*c = ab$$

$$ac + ca = 0$$

We have several explicit models for this, using the spheres $S_{\mathbb{R},+}^1$ and $S_{\mathbb{C},+}^1$, as well as the first row spaces of O_2^+ and U_2^+ , which ultimately lead us to SU_2 and \overline{SU}_2 . These models are known to be all equivalent under Haar, and the question is whether they are identical. Thus, we must do computations as above in all models, and compare. These are all interesting questions, whose precise answers are not known, so far.

In the 3D case now, that of projective space P_+^2 , that we are mainly interested in here, the matrix of coordinates is as follows, with r, s, t self-adjoint, $r + s + t = 1$:

$$p = \begin{pmatrix} r & a & b \\ a^* & s & c \\ b^* & c^* & t \end{pmatrix}$$

The square of this matrix is given by:

$$p^2 = \begin{pmatrix} r & a & b \\ a^* & s & c \\ b^* & c^* & t \end{pmatrix} \begin{pmatrix} r & a & b \\ a^* & s & c \\ b^* & c^* & t \end{pmatrix}$$

We obtain the following formula:

$$p^2 = \begin{pmatrix} r^2 + aa^* + bb^* & ra + as + bc^* & rb + ac + bt \\ a^*r + sa^* + cb^* & a^*a + s^2 + cc^* & a^*b + sc + ct \\ b^*r + c^*a^* + tb^* & b^*a + c^*s + tc^* & b^*b + c^*c + t^2 \end{pmatrix}$$

On the diagonal, the equations for $p^2 = p$ are as follows:

$$aa^* + bb^* = r - r^2$$

$$a^*a + cc^* = s - s^2$$

$$b^*b + c^*c = t - t^2$$

On the off-diagonal upper part, the equations for $p^2 = p$ are as follows:

$$ra + as + bc^* = a$$

$$rb + ac + bt = b$$

$$a^*b + sc + ct = c$$

On the off-diagonal lower part, the equations for $p^2 = p$ are those above, conjugated. Thus, we have 6 equations. The first problem is that of using $r + s + t = 1$, in order to make these equations look better. Again, many interesting questions here.

CHAPTER 8

Matrix models

8a. Matrix models

You can model everything with random matrices, the saying in analysis goes. We have already seen an instance of this phenomenon in chapter 9, when talking about half-liberation. To be more precise, for certain manifolds $X \subset S_{\mathbb{C},*}^{N-1}$, we have constructed embeddings of algebras of the following type, with Y being a certain classical manifold, and $T_1, \dots, T_N \in M_2(C(Y))$ being certain suitable antidiagonal 2×2 matrices:

$$\pi : C(X) \subset M_2(C(Y)) \quad , \quad x_i \rightarrow T_i$$

These models, which are quite powerful, were used afterwards in order to establish several non-trivial results on the original half-classical manifolds $X \subset S_{\mathbb{C},*}^{N-1}$. Indeed, some knowledge and patience helping, any computation inside the target algebra $M_2(C(Y))$ can only be fun and doable, and produce results about $X \subset S_{\mathbb{C},*}^{N-1}$ itself.

We discuss here, following [10], modeling questions for general manifolds $X \subset S_{\mathbb{C},+}^{N-1}$, by using the same idea, suitably modified and generalized, as to cover most of the manifolds that we are interested in. Let us start with a broad definition, as follows:

DEFINITION 8.1. *A model for a real algebraic manifold $X \subset S_{\mathbb{C},+}^{N-1}$ is a morphism of C^* -algebras of the following type,*

$$\pi : C(X) \rightarrow B$$

with B being a C^ -algebra, called target of the model. We say that the model is faithful if π is faithful, in the usual sense.*

Obviously, this is something too broad, because we can simply take $B = C(X)$, and we have in this way our faithful model, which is of course something unuseful:

$$id : C(X) \rightarrow C(X)$$

Thus, we must suitably restrict the class of target algebras B that we use, to algebras that we know well. However, this is something quite tricky, because if we want our model to be faithful, we cannot use simple algebras like the algebras $M_2(C(Y))$ used in the half-classical setting. In short, we are running into some difficulties here, of functional analytic nature, and a systematic discussion of all this is needed.

As a first objective, let us try to understand if an arbitrary manifold $X \subset S_{\mathbb{C},+}^{N-1}$ can be modelled by using familiar variables such as usual matrices, or operators. The answer here is yes, when using operators on a separable Hilbert space, with this coming from the GNS representation theorem, that we know from chapter 1, which is as follows:

THEOREM 8.2. *Any C^* -algebra A appears as closed $*$ -algebra of operators on a Hilbert space, $A \subset B(H)$, in the following way:*

- (1) *In the commutative case, where $A = C(X)$, we can set $H = L^2(X)$, with respect to some probability measure on X , and use the embedding $g \rightarrow (g \rightarrow fg)$.*
- (2) *In general, we can set $H = L^2(A)$, with respect to some faithful positive trace $tr : A \rightarrow \mathbb{C}$, and then use a similar embedding, $a \rightarrow (b \rightarrow ab)$.*

PROOF. This is something that we already know, from chapter 1, coming from basic measure theory and functional analysis, the idea being as follows:

(1) In the commutative case, where $A = C(X)$ by the Gelfand theorem, we can pick a probability measure on X , and then we have an embedding as follows:

$$C(X) \subset B(L^2(X)) \quad , \quad f \rightarrow (g \rightarrow fg)$$

(2) In general, assuming that a linear form $\varphi : A \rightarrow \mathbb{C}$ has suitable positivity properties, we can define a scalar product on A , by the following formula:

$$\langle a, b \rangle = \varphi(ab^*)$$

By completing we obtain a Hilbert space H , and we have a representation as follows, called GNS representation of our algebra with respect to the linear form φ :

$$A \rightarrow B(H) \quad , \quad a \rightarrow (b \rightarrow ab)$$

Moreover, when $\varphi : A \rightarrow \mathbb{C}$ has suitable faithfulness properties, making it analogous to the integration functionals $\int_X : A \rightarrow \mathbb{C}$ from the commutative case, with respect to faithful probability measures on X , this representation is faithful, as desired. \square

Now back to our questions, the above result tells us that we have:

THEOREM 8.3. *Given an algebraic manifold $X \subset S_{\mathbb{C},+}^{N-1}$, coming via*

$$C(X) = C(S_{\mathbb{C},+}^{N-1}) / \left\langle f_\alpha(x_1, \dots, x_N) = 0 \right\rangle$$

we have a morphism of C^ -algebras as follows,*

$$\pi : C(X) \rightarrow B(H) \quad , \quad x_i \rightarrow T_i$$

whenever the operators $T_i \in B(H)$ satisfy the following relations:

$$\sum_i T_i T_i^* = \sum_i T_i^* T_i = 1 \quad , \quad f_\alpha(T_1, \dots, T_N) = 0$$

Moreover, we can always find a Hilbert space H and operators $\{T_i\}$ such that π is faithful.

PROOF. Here the first assertion is more of an empty statement, explaining the definition of the algebra $C(X)$, via generators and relations, and the second assertion is something non-trivial, coming as a consequence of the GNS theorem. \square

In practice now, all this is a bit too general, and not very useful. We need a good family of target algebras B , that we understand well. And here, we can use:

DEFINITION 8.4. *A random matrix C^* -algebra is an algebra of type*

$$B = M_K(C(T))$$

with T being a compact space, and $K \in \mathbb{N}$ being an integer.

The terminology here comes from the fact that, in practice, the space T usually comes with a probability measure on it, which makes the elements of B “random matrices”. Observe that we can write our random matrix algebra as follows:

$$B = M_K(\mathbb{C}) \otimes C(T)$$

Thus, the random matrix algebras appear by definition as tensor products of the simplest types of C^* -algebras that we know, namely the full matrix algebras, $M_K(\mathbb{C})$ with $K \in \mathbb{N}$, and the commutative algebras, $C(T)$, with T being a compact space. Getting back now to our modelling questions for manifolds, we can formulate:

DEFINITION 8.5. *A matrix model for a noncommutative algebraic manifold*

$$X \subset S_{\mathbb{C},+}^{N-1}$$

is a morphism of C^ -algebras of the following type,*

$$\pi : C(X) \rightarrow M_K(C(T))$$

with T being a compact space, and $K \in \mathbb{N}$ being an integer.

As a first observation, when X happens to be classical, we can take $K = 1$ and $T = X$, and we have a faithful model for our manifold, namely:

$$id : C(X) \rightarrow M_1(C(X))$$

In general, we cannot use $K = 1$, and the smallest value $K \in \mathbb{N}$ doing the job, if any, will correspond somehow to the “degree of noncommutativity” of our manifold.

Before getting into this, we would like to clarify a few abstract issues. As mentioned above, the algebras of type $B = M_K(C(T))$ are called random matrix C^* -algebras. The reason for this is the fact that most of the interesting compact spaces T come by definition with a natural probability measure of them. Thus, B is a subalgebra of the bigger algebra $B'' = M_K(L^\infty(T))$, usually known as a “random matrix algebra”.

This perspective is quite interesting for us, because most of our examples of manifolds $X \subset X_{\mathbb{C},+}^{N-1}$ appear as homogeneous spaces, and so are measured spaces too. Thus, we

can further ask for our models $C(X) \rightarrow M_K(C(T))$ to extend into models of the following type, which can be of help in connection with integration problems:

$$L^\infty(X) \rightarrow M_K(L^\infty(T))$$

In short, time now to talk about L^∞ -functions, in the noncommutative setting.

8b. Operator algebras

In order to discuss all this, we will need some basic von Neumann algebra theory, coming as a complement to the basic C^* -algebra theory from chapter 1. Let us start with a key result in functional analysis, as follows:

PROPOSITION 8.6. *For an operator algebra $A \subset B(H)$, the following are equivalent:*

- (1) *A is closed under the weak operator topology, making each of the linear maps $T \rightarrow \langle Tx, y \rangle$ continuous.*
- (2) *A is closed under the strong operator topology, making each of the linear maps $T \rightarrow Tx$ continuous.*

In the case where these conditions are satisfied, A is closed under the norm topology.

PROOF. There are several statements here, the proof being as follows:

(1) It is clear that the norm topology is stronger than the strong operator topology, which is in turn stronger than the weak operator topology. At the level of the subsets $S \subset B(H)$ which are closed things get reversed, in the sense that weakly closed implies strongly closed, which in turn implies norm closed. Thus, we are left with proving that for any algebra $A \subset B(H)$, strongly closed implies weakly closed.

(2) But this latter fact is something standard, which can be proved via an amplification trick. Consider the Hilbert space obtained by summing n times H with itself:

$$K = H \oplus \dots \oplus H$$

The operators over K can be regarded as being square matrices with entries in $B(H)$, and in particular, we have a representation $\pi : B(H) \rightarrow B(K)$, as follows:

$$\pi(T) = \begin{pmatrix} T & & \\ & \ddots & \\ & & T \end{pmatrix}$$

Assume now that we are given an operator $T \in \bar{A}$, with the bar denoting the weak closure. We have then, by using the Hahn-Banach theorem, for any $x \in K$:

$$\begin{aligned} T \in \bar{A} &\implies \pi(T) \in \overline{\pi(A)} \\ &\implies \pi(T)x \in \overline{\pi(A)x} \\ &\implies \pi(T)x \in \overline{\pi(A)x}^{\|\cdot\|} \end{aligned}$$

Now observe that the last formula tells us that for any $x = (x_1, \dots, x_n)$, and any $\varepsilon > 0$, we can find $S \in A$ such that the following holds, for any i :

$$\|Sx_i - Tx_i\| < \varepsilon$$

Thus T belongs to the strong operator closure of A , as desired. \square

In the above the terminology, while standard, is a bit confusing, because the norm topology is stronger than the strong operator topology. As a solution, we agree in what follows to call the norm topology “strong”, and the weak and strong operator topologies “weak”, whenever these two topologies coincide. With this convention, the algebras from Proposition 8.6 are those which are weakly closed, and we can formulate:

DEFINITION 8.7. *A von Neumann algebra is a $*$ -algebra of operators*

$$A \subset B(H)$$

which is closed under the weak topology.

As basic examples, we have the algebra $B(H)$ itself, then the singly generated von Neumann algebras, $A = \langle T \rangle$, with $T \in B(H)$, and then the multiply generated von Neumann algebras, namely $A = \langle T_i \rangle$, with $T_i \in B(H)$. At the level of the general results, we first have the bicommutant theorem of von Neumann, as follows:

THEOREM 8.8. *For a $*$ -algebra $A \subset B(H)$, the following are equivalent:*

- (1) *A is weakly closed, so it is a von Neumann algebra.*
- (2) *A equals its algebraic bicommutant A'' , taken inside $B(H)$.*

PROOF. Since the commutants are automatically weakly closed, it is enough to show that weakly closed implies $A = A''$. For this purpose, we will prove something a bit more general, stating that given a $*$ -algebra of operators $A \subset B(H)$, the following holds, with A'' being the bicommutant inside $B(H)$, and with \bar{A} being the weak closure:

$$A'' = \bar{A}$$

We prove this equality by double inclusion, as follows:

“ \supset ” Since any operator commutes with the operators that it commutes with, we have a trivial inclusion $S \subset S''$, valid for any set $S \subset B(H)$. In particular, we have:

$$A \subset A''$$

Our claim now is that the algebra A'' is closed, with respect to the strong operator topology. Indeed, assuming that we have $T_i \rightarrow T$ in this topology, we have:

$$\begin{aligned} T_i \in A'' &\implies ST_i = T_iS, \quad \forall S \in A' \\ &\implies ST = TS, \quad \forall S \in A' \\ &\implies T \in A \end{aligned}$$

Thus our claim is proved, and together with Proposition 8.6, which allows us to pass from the strong to the weak operator topology, this gives the desired inclusion:

$$\bar{A} \subset A''$$

“ \subset ” Here we must prove that we have the following implication, valid for any $T \in B(H)$, with the bar denoting as usual the weak operator closure:

$$T \in A'' \implies T \in \bar{A}$$

For this purpose, we use the same amplification trick as in the proof of Proposition 8.5. Consider the Hilbert space obtained by summing n times H with itself:

$$K = H \oplus \dots \oplus H$$

The operators over K can be regarded as being square matrices with entries in $B(H)$, and in particular, we have a representation $\pi : B(H) \rightarrow B(K)$, as follows:

$$\pi(T) = \begin{pmatrix} T & & \\ & \ddots & \\ & & T \end{pmatrix}$$

The idea will be that of doing the computations in this representation. First, in this representation, the image of our algebra $A \subset B(H)$ is given by:

$$\pi(A) = \left\{ \begin{pmatrix} T & & \\ & \ddots & \\ & & T \end{pmatrix} \mid T \in A \right\}$$

We can compute the commutant of this image, exactly as in the usual scalar matrix case, and we obtain the following formula:

$$\pi(A)' = \left\{ \begin{pmatrix} S_{11} & \dots & S_{1n} \\ \vdots & & \vdots \\ S_{n1} & \dots & S_{nn} \end{pmatrix} \mid S_{ij} \in A' \right\}$$

We conclude from this that, given an operator $T \in A''$ as above, we have:

$$\begin{pmatrix} T & & \\ & \ddots & \\ & & T \end{pmatrix} \in \pi(A)''$$

In other words, the conclusion of all this is that we have:

$$T \in A'' \implies \pi(T) \in \pi(A)''$$

Now given a vector $x \in K$, consider the orthogonal projection $P \in B(K)$ on the norm closure of the vector space $\pi(A)x \subset K$. Since the subspace $\pi(A)x \subset K$ is invariant under

the action of $\pi(A)$, so is its norm closure inside K , and we obtain from this:

$$P \in \pi(A)'$$

By combining this with what we found above, we conclude that we have:

$$T \in A'' \implies \pi(T)P = P\pi(T)$$

Now since this holds for any $x \in K$, we conclude that any $T \in A''$ belongs to the strong operator closure of A . By using now Proposition 8.5, which allows us to pass from the strong to the weak operator closure, we conclude that we have $A'' \subset \bar{A}$, as desired. \square

In order to develop now some general theory, let us start by investigating the finite dimensional case. Here the ambient operator algebra is $B(H) = M_N(\mathbb{C})$, and any subspace $A \subset B(H)$ is automatically closed, for all 3 topologies from Proposition 8.6. Thus, we are left with the question of investigating the $*$ -algebras of usual matrices $A \subset M_N(\mathbb{C})$. But this is a purely algebraic question, whose answer is as follows:

THEOREM 8.9. *The $*$ -algebras $A \subset M_N(\mathbb{C})$ are exactly the algebras of the form*

$$A = M_{n_1}(\mathbb{C}) \oplus \dots \oplus M_{n_k}(\mathbb{C})$$

depending on parameters $k \in \mathbb{N}$ and $n_1, \dots, n_k \in \mathbb{N}$ satisfying

$$n_1 + \dots + n_k = N$$

embedded into $M_N(\mathbb{C})$ via the obvious block embedding, twisted by a unitary $U \in U_N$.

PROOF. We have two assertions to be proved, the idea being as follows:

(1) Given numbers $n_1, \dots, n_k \in \mathbb{N}$ satisfying $n_1 + \dots + n_k = N$, we have an obvious embedding of $*$ -algebras, via matrix blocks, as follows:

$$M_{n_1}(\mathbb{C}) \oplus \dots \oplus M_{n_k}(\mathbb{C}) \subset M_N(\mathbb{C})$$

In addition, we can twist this embedding by a unitary $U \in U_N$, as follows:

$$M \rightarrow UMU^*$$

(2) In the other sense now, consider an arbitrary $*$ -algebra of the $N \times N$ matrices, $A \subset M_N(\mathbb{C})$. Let us first look at the center of this algebra, which given by:

$$Z(A) = A \cap A'$$

It is elementary to prove that this center, as an algebra, is of the following form:

$$Z(A) \simeq \mathbb{C}^k$$

Consider now the standard basis $e_1, \dots, e_k \in \mathbb{C}^k$, and let $p_1, \dots, p_k \in Z(A)$ be the images of these vectors via the above identification. In other words, these elements $p_1, \dots, p_k \in A$ are central minimal projections, summing up to 1:

$$p_1 + \dots + p_k = 1$$

The idea is then that this partition of the unity will eventually lead to the block decomposition of A , as in the statement. We prove this in 4 steps, as follows:

Step 1. We first construct the matrix blocks, our claim here being that each of the following linear subspaces of A are non-unital $*$ -subalgebras of A :

$$A_i = p_i A p_i$$

But this is clear, with the fact that each A_i is closed under the various non-unital $*$ -subalgebra operations coming from the projection equations $p_i^2 = p_i^* = p_i$.

Step 2. We prove now that the above algebras $A_i \subset A$ are in a direct sum position, in the sense that we have a non-unital $*$ -algebra sum decomposition, as follows:

$$A = A_1 \oplus \dots \oplus A_k$$

As with any direct sum question, we have two things to be proved here. First, by using the formula $p_1 + \dots + p_k = 1$ and the projection equations $p_i^2 = p_i^* = p_i$, we conclude that we have the needed generation property, namely:

$$A_1 + \dots + A_k = A$$

As for the fact that the sum is indeed direct, this follows as well from the formula $p_1 + \dots + p_k = 1$, and from the projection equations $p_i^2 = p_i^* = p_i$.

Step 3. Our claim now, which will finish the proof, is that each of the $*$ -subalgebras $A_i = p_i A p_i$ constructed above is a full matrix algebra. To be more precise here, with $n_i = \text{rank}(p_i)$, our claim is that we have isomorphisms, as follows:

$$A_i \simeq M_{n_i}(\mathbb{C})$$

In order to prove this claim, recall that the projections $p_i \in A$ were chosen central and minimal. Thus, the center of each of the algebras A_i reduces to the scalars:

$$Z(A_i) = \mathbb{C}$$

But this shows, either via a direct computation, or via the bicommutant theorem, that each of the algebras A_i is a full matrix algebra, as claimed.

Step 4. We can now obtain the result, by putting together what we have. Indeed, by using the results from Step 2 and Step 3, we obtain an isomorphism as follows:

$$A = A_1 \oplus \dots \oplus A_k \simeq M_{n_1}(\mathbb{C}) \oplus \dots \oplus M_{n_k}(\mathbb{C})$$

Moreover, a careful look at the isomorphisms established in Step 3 shows that at the global level, of the algebra A itself, the above isomorphism comes by twisting the standard multimatrix embedding $M_{n_1}(\mathbb{C}) \oplus \dots \oplus M_{n_k}(\mathbb{C}) \subset M_N(\mathbb{C})$, discussed in the beginning of the proof, (1) above, by a certain unitary $U \in U_N$. Thus, we obtain the result. \square

As an application of Theorem 8.9, clarifying the relation with linear algebra, or operator theory in finite dimensions, we have the following result:

PROPOSITION 8.10. *Given an operator $T \in B(H)$ in finite dimensions, $H = \mathbb{C}^N$, the von Neumann algebra $A = \langle T \rangle$ that it generates inside $B(H) = M_N(\mathbb{C})$ is*

$$A = M_{r_1}(\mathbb{C}) \oplus \dots \oplus M_{r_k}(\mathbb{C})$$

with the sizes of the blocks $r_1, \dots, r_k \in \mathbb{N}$ coming from the spectral theory of the associated matrix $M \in M_N(\mathbb{C})$. In the normal case $TT^ = T^*T$, this decomposition comes from*

$$T = UDU^*$$

with $D \in M_N(\mathbb{C})$ diagonal, and with $U \in U_N$ unitary.

PROOF. This is something standard, by using the basic linear algebra theory and spectral theory for the usual matrices $M \in M_N(\mathbb{C})$. \square

Let us get now to infinite dimensions, with Proposition 8.10 as our main source of inspiration. We have here the following result:

THEOREM 8.11. *Given an operator $T \in B(H)$ which is normal,*

$$TT^* = T^*T$$

the von Neumann algebra $A = \langle T \rangle$ that it generates inside $B(H)$ is

$$\langle T \rangle = L^\infty(\sigma(T))$$

with $\sigma(T)$ being its spectrum, formed of numbers $\lambda \in \mathbb{C}$ such that $T - \lambda$ is not invertible.

PROOF. This is something standard as well, by using the spectral theory for the normal operators $T \in B(H)$, coming from chapter 1. \square

More generally, along the same lines, we have the following result, dealing this time with commuting families of normal operators:

THEOREM 8.12. *Given operators $T_i \in B(H)$ which are normal, and which commute, the von Neumann algebra $A = \langle T_i \rangle$ that these operators generates inside $B(H)$ is*

$$\langle T_i \rangle = L^\infty(X)$$

with X being a certain measured space, associated to the family $\{T_i\}$.

PROOF. This is again routine, by using this time the spectral theory for the families of commuting normal operators $T_i \in B(H)$. See for instance Blackadar. \square

As an interesting abstract consequence of this, we have:

THEOREM 8.13. *The commutative von Neumann algebras are the algebras of type*

$$A = L^\infty(X)$$

with X being a measured space.

PROOF. We have two assertions to be proved, the idea being as follows:

(1) In one sense, we must prove that given a measured space X , we can realize the commutative algebra $A = L^\infty(X)$ as a von Neumann algebra, on a certain Hilbert space H . But this is something that we already know, coming from the multiplicity operators $T_f(g) = fg$ from the proof of the GNS theorem, the representation being as follows:

$$L^\infty(X) \subset B(L^2(X))$$

(2) In the other sense, given a commutative von Neumann algebra $A \subset B(H)$, we must construct a certain measured space X , and an identification $A = L^\infty(X)$. But this follows from Theorem 8.12, because we can write our algebra as follows:

$$A = \langle T_i \rangle$$

To be more precise, A being commutative, any element $T \in A$ is normal. Thus, we can pick a basis $\{T_i\} \subset A$, and then we have $A = \langle T_i \rangle$ as above, with $T_i \in B(H)$ being commuting normal operators. Thus Theorem 8.12 applies, and gives the result. \square

Moving ahead now, we can combine Proposition 8.8 with Theorem 8.13, and by building along the lines of Theorem 8.9, but this time in infinite dimensions, we are led to the following statement, due to Murray-von Neumann and Connes:

THEOREM 8.14. *Given a von Neumann algebra $A \subset B(H)$, if we write its center as*

$$Z(A) = L^\infty(X)$$

then we have a decomposition as follows, with the fibers A_x having trivial center:

$$A = \int_X A_x dx$$

Moreover, the factors, $Z(A) = \mathbb{C}$, can be basically classified in terms of the II_1 factors, which are those satisfying $\dim A = \infty$, and having a faithful trace $\text{tr} : A \rightarrow \mathbb{C}$.

PROOF. This is something that we know to hold in finite dimensions, as a consequence of Theorem 8.9. In general, this is something heavy, the idea being as follows:

(1) This is von Neumann's reduction theory main result, whose statement is already quite hard to understand, and whose proof uses advanced functional analysis.

(2) This is heavy, due to Murray-von Neumann and Connes, the idea being that the other factors can be basically obtained via crossed product constructions. \square

All this is certainly quite advanced, taking substantial time to be fully understood. For general reading on von Neumann algebras we recommend the book of Blackadar, but be aware though that, while being at the same time well-written, condensed and reasonably thick, that book is only an introduction to Theorem 8.14. So, if we want to learn the full theory, with the complete proof of Theorem 8.14, you will have to go, every now and then, through the original papers of Murray-von Neumann and Connes.

Now back to work, and our noncommutative geometry questions, as a first application of the above, we can extend our noncommutative space setting, as follows:

THEOREM 8.15. *Consider the category of “noncommutative measure spaces”, having as objects the pairs (A, tr) consisting of a von Neumann algebra with a faithful trace, and with the arrows reversed, which amounts in writing $A = L^\infty(X)$ and $\text{tr} = \int_X$.*

- (1) *The category of usual measured spaces embeds into this category, and we obtain in this way the objects whose associated von Neumann algebra is commutative.*
- (2) *Each C^* -algebra given with a trace produces as well a noncommutative measure space, by performing the GNS construction, and taking the weak closure.*
- (3) *In what regards the finitely generated group duals, or more generally the compact matrix quantum groups, the corresponding identification is injective.*
- (4) *Even more generally, for noncommutative algebraic manifolds having an integration functional, like the spheres, the identification is injective.*

PROOF. This is clear indeed from the basic properties of the GNS construction, from Theorem 8.2, and from the general theory from Theorem 8.14. \square

Before getting back to matrix models, we would like to formulate the following result, in relation with our axiomatization questions discussed in the above:

THEOREM 8.16. *In the context of noncommutative geometries coming from quadruplets (S, T, U, K) , we have von Neumann algebras, with traces, as follows,*

$$\begin{array}{ccc}
 L^\infty(S) & \longleftrightarrow & L^\infty(T) \\
 \uparrow & \swarrow & \searrow \\
 & & \\
 & \nwarrow & \nearrow \\
 L^\infty(U) & \longleftrightarrow & L^\infty(K) \\
 \downarrow & & \downarrow
 \end{array}$$

with $L^\infty(S) \subset L^\infty(U)$ being obtained by taking the first row algebra.

PROOF. This follows indeed from the various results that we already have, from above, by using the general formalism from Theorem 8.15. \square

This statement, which is quite interesting, philosophically speaking, raises the question of axiomatizing, or rather re-axiomatizing, the quadruplets (S, T, U, K) that we are interested in directly in terms of the associated von Neumann algebras, as above. Indeed, in view of our general quantum mechanics motivations, we are after all mostly interested in integrating over our quantum manifolds, and so with this in mind, the von Neumann algebra formalism seems to be the one which is best adapted to our questions.

However, this is wrong. The above result is something theoretical, because it assumes the existence of Haar measures on our spaces S, T, U, K , which itself is something coming

as a theorem. Thus, while all this is nice, the good way of doing things is with C^* -algebras, as we did before. And the von Neumann algebras from Theorem 8.16 remain something more advanced and specialized, coming afterwards.

As a side comment here, and for ending with some physics, the question “does the algebra or the Hilbert space come first” is a well-known one in quantum mechanics, basically leading to 2 different schools of thought. We obviously adhere here to the “algebra comes first” school. But let us not get here into this, perhaps enough controversies discussed, so far in this book. For more on this, get to know about the Bohr vs Einstein debate, which is the mother of all debates, in quantum mechanics.

8c. Matrix truncations

In relation now with the modelling questions that we are interested in here, with all the above operator algebra material digested, we can now go ahead with our program, and discuss von Neumann algebraic extensions. We have the following result:

THEOREM 8.17. *Given a matrix model $\pi : C(X) \rightarrow M_K(C(T))$, with both X, T being assumed to have integration functionals, the following are equivalent:*

- (1) π is stationary, in the sense that $\int_X = (\text{tr} \otimes \int_T)\pi$.
- (2) π produces an inclusion $\pi' : C_{red}(X) \subset M_K(X(T))$.
- (3) π produces an inclusion $\pi'' : L^\infty(X) \subset M_K(L^\infty(T))$.

Moreover, in the quantum group case, these conditions imply that π is faithful.

PROOF. This is standard functional analysis, as follows:

(1) Consider the following diagram, with all the solid arrows being by definition the canonical maps between the algebras concerned:

$$\begin{array}{ccccc}
 M_K(C(T)) & \xrightarrow{\hspace{10em}} & M_K(L^\infty(T)) & & \\
 \uparrow \pi & \swarrow \pi' & \uparrow \pi'' & & \\
 C(X) & \xrightarrow{\hspace{2em}} & C_{red}(X) & \xrightarrow{\hspace{2em}} & L^\infty(X)
 \end{array}$$

(2) With this picture in hand, the implications (1) \iff (2) \iff (3) between the conditions (1,2,3) in the statement are all clear, coming from the basic properties of the GNS construction, and of the von Neumann algebras, explained in the above.

(3) As for the last assertion, this is something more subtle, coming from the fact that if $L^\infty(G)$ is of type I, as required by (3), then G must be coamenable. \square

The above result raises a number of interesting questions, notably in what regards the extension of the last assertion, to the case of more general homogeneous spaces.

Before going further, we would like to record as well the following key result regarding the matrix models, valid so far in the quantum group case only:

THEOREM 8.18. *Consider a matrix model $\pi : C(G) \rightarrow M_K(C(T))$ for a closed subgroup $G \subset U_N^+$, with T being assumed to be a compact probability space.*

- (1) *There exists a smallest subgroup $G' \subset G$, producing a factorization of type:*

$$\pi : C(G) \rightarrow C(G') \rightarrow M_K(C(T))$$

The algebra $C(G')$ is called Hopf image of π .

- (2) *When π is inner faithful, in the sense that $G = G'$, we have the formula*

$$\int_G = \lim_{k \rightarrow \infty} \sum_{r=1}^k \varphi^{*r}$$

*where $\varphi = (\text{tr} \otimes \int_T)\pi$, and $\phi * \psi = (\phi \otimes \psi)\Delta$.*

PROOF. All this is well-known, but quite specialized, the idea being as follows:

(1) This follows by dividing the algebra $C(G)$ by a suitable ideal, namely the Hopf ideal generated by the kernel of the matrix model map $\pi : C(G) \rightarrow M_K(C(T))$.

(2) This follows by suitably adapting Woronowicz's proof for the existence and formula of the Haar integration functional from [99], to the matrix model situation. \square

The above result is quite important, for a number of reasons. Indeed, as a main application of it, while the existence of a faithful matrix model $\pi : C(G) \subset M_K(C(T))$ forces the C^* -algebra $C(G)$ to be of type I, and so G to be coamenable, as already mentioned in the proof of Theorem 8.17, there is no known restriction coming from the existence of an inner faithful model $\pi : C(G) \rightarrow M_K(C(T))$.

In the general manifold setting, talking about such things is in general not possible, unless our manifold X has some extra special structure, as for instance being an homogeneous space, in the spirit of the various such spaces discussed in chapters 5-6. However, in practice, such a theory has not been developed yet.

Let us go back now to our basic notion of a matrix model, from Definition 8.5, and develop some more general theory, in that setting. We first have:

PROPOSITION 8.19. *A 1×1 model for a manifold $X \subset S_{\mathbb{C},+}^{N-1}$ must come from a map*

$$p : T \rightarrow X_{class} \subset X$$

and π is faithful precisely when $X = X_{class}$, and when p is surjective.

PROOF. According to our conventions, a 1×1 model for a manifold $X \subset S_{\mathbb{C},+}^{N-1}$ is simply a morphism of algebras $\pi : C(X) \rightarrow C(T)$. Now since $C(T)$ is commutative, this morphism must factorize through the abelianization of $C(X)$, as follows:

$$\pi : C(X) \rightarrow C(X_{class}) \rightarrow C(T)$$

Thus, our morphism π must come by transposition from a map p , as claimed. \square

Following [10], in order to generalize the above trivial fact, we can use:

DEFINITION 8.20. Let $X \subset S_{\mathbb{C},+}^{N-1}$. We define a closed subspace $X^{(K)} \subset X$ by

$$C(X^{(K)}) = C(X)/J_K$$

where J_K is the common null space of matrix representations of $C(X)$, of size $L \leq K$,

$$J_K = \bigcap_{L \leq K} \bigcap_{\pi: C(X) \rightarrow M_L(\mathbb{C})} \ker(\pi)$$

and we call $X^{(K)}$ the “part of X which is realizable with $K \times K$ models”.

As a basic example here, the first such space, at $K = 1$, is the classical version:

$$X^{(1)} = X_{class}$$

Observe that we have embeddings of quantum spaces, as follows:

$$X^{(1)} \subset X^{(2)} \subset X^{(3)} \dots \subset X$$

As a first result now on these spaces, we have the following well-known fact:

THEOREM 8.21. The increasing union of compact quantum spaces

$$X^{(\infty)} = \bigcup_{K \geq 1} X^{(K)}$$

equals X precisely when the algebra $C(X)$ is residually finite dimensional.

PROOF. This is something well-known. We refer to Chirvasitu for a discussion on this topic, in the context of the quantum groups, and to [10] for more. \square

Getting back now to the case $K < \infty$, we first have, following [10]:

PROPOSITION 8.22. Consider an algebraic manifold $X \subset S_{\mathbb{C},+}^{N-1}$.

- (1) Given a closed subspace $Y \subset X \subset S_{\mathbb{C},+}^{N-1}$, we have $Y \subset X^{(K)}$ precisely when any irreducible representation of $C(Y)$ has dimension $\leq K$.
- (2) In particular, we have $X^{(K)} = X$ precisely when any irreducible representation of $C(X)$ has dimension $\leq K$.

PROOF. This follows from general C^* -algebra theory, as follows:

(1) If any irreducible representation of $C(Y)$ has dimension $\leq K$, then we have $Y \subset X^{(K)}$, because the irreducible representations of a C^* -algebra separate its points. Conversely, assuming $Y \subset X^{(K)}$, it is enough to show that any irreducible representation of the algebra $C(X^{(K)})$ has dimension $\leq K$. But this is once again well-known.

(2) This follows indeed from (1). \square

The connection with the previous considerations comes from:

THEOREM 8.23. *If $X \subset S_{\mathbb{C},+}^{N-1}$ has a faithful matrix model*

$$C(X) \rightarrow M_K(C(T))$$

then we have $X = X^{(K)}$.

PROOF. This follows from the above and from the standard representation theory for the C^* -algebras. For full details on all this, we refer as before to [10]. \square

We can now discuss the universal $K \times K$ -matrix model, constructed as follows:

THEOREM 8.24. *Given $X \subset S_{\mathbb{C},+}^{N-1}$ algebraic, the category of its $K \times K$ matrix models, with $K \geq 1$ being fixed, has a universal object as follows:*

$$\pi_K : C(X) \rightarrow M_K(C(T_K))$$

That is, given a model $\rho : C(X) \rightarrow M_K(C(T))$, we have a diagram of type

$$\begin{array}{ccc} C(X) & \xrightarrow{\pi} & M_K(C(T_K)) \\ & \searrow \rho & \swarrow \\ & M_K(C(T)) & \end{array}$$

where the map on the right is unique, and arises from a continuous map $T \rightarrow T_K$.

PROOF. Consider the universal commutative C^* -algebra generated by elements $x_{ij}(a)$, with $1 \leq i, j \leq K$ and $a \in \mathcal{O}(X)$, subject to the following relations:

$$x_{ij}(a + \lambda b) = x_{ij}(a) + \lambda x_{ij}(b)$$

$$x_{ij}(ab) = \sum_k x_{ik}(a)x_{kj}(b)$$

$$x_{ij}(1) = \delta_{ij}$$

$$x_{ij}(a)^* = x_{ji}(a^*)$$

This algebra is indeed well-defined because of the following relations:

$$\sum_l \sum_k x_{ik}(z_l^*)x_{ki}(z_l) = 1$$

Now let T_K be the spectrum of this algebra. Since X is algebraic, we have:

$$\pi : C(X) \rightarrow M_K(C(T_K)) \quad , \quad \pi(z_k) = (x_{ij}(z_k))$$

By construction of T_K and π , we have the universal matrix model. See [10]. \square

Still following [10], as an illustration for the above, we have:

PROPOSITION 8.25. *Let $X \subset S_{\mathbb{C},+}^{N-1}$ with X algebraic and $X_{class} \neq \emptyset$, and let*

$$\pi : C(X) \rightarrow M_K(C(T_K))$$

be the universal matrix model. Then we have

$$C(X^{(K)}) = C(X)/Ker(\pi)$$

and hence $X = X^{(K)}$ if and only if X has a faithful $K \times K$ -matrix model.

PROOF. We have to prove that $Ker(\pi) = J_K$, the latter ideal being the intersection of the kernels of all matrix representations as follows, with $L \leq K$:

$$C(X) \rightarrow M_L(\mathbb{C})$$

For $a \notin Ker(\pi)$, we see that $a \notin J_K$ by evaluating at an appropriate element of T_K . Conversely, assume that we are given $a \in Ker(\pi)$. Let $\rho : C(X) \rightarrow M_L(\mathbb{C})$ be a representation with $L \leq K$, and let $\varepsilon : C(X) \rightarrow \mathbb{C}$ be a representation. We can extend ρ to a representation $\rho' : C(X) \rightarrow M_K(\mathbb{C})$ by letting, for any $b \in C(X)$:

$$\rho'(b) = \begin{pmatrix} \rho(b) & 0 \\ 0 & \varepsilon(b)I_{K-L} \end{pmatrix}$$

The universal property of the universal matrix model yields that $\rho'(a) = 0$, since $\pi(a) = 0$. Thus $\rho(a) = 0$. We therefore have $a \in J_K$, and $Ker(\pi) \subset J_K$, and the first statement is proved. The last statement follows from the first one. See [10]. \square

Next, we have the following result, also from [10]:

PROPOSITION 8.26. *Let $X \subset S_{\mathbb{C},+}^{N-1}$ be algebraic, and satisfying:*

$$X_{class} \neq \emptyset$$

Then $X^{(K)}$ is algebraic as well.

PROOF. We keep the notations above, and consider the following map:

$$\pi_0 : \mathcal{O}(X) \rightarrow M_K(C(T_K)) \quad , \quad z_l \rightarrow (x_{ij}(z_l))$$

This induces a $*$ -algebra map, as follows:

$$\tilde{\pi}_0 : C^*(\mathcal{O}(X)/Ker(\pi_0)) \rightarrow M_K(C(T_K))$$

We need to show that $\tilde{\pi}_0$ is injective. For this purpose, observe that the universal model factorizes as follows, where p is canonical surjection:

$$\pi : C(X) \xrightarrow{p} C^*(\mathcal{O}(X)/Ker(\pi_0)) \xrightarrow{\tilde{\pi}_0} M_K(C(T_K))$$

We therefore obtain $\text{Ker}(\pi) = \text{Ker}(p)$, and we conclude that:

$$C(X^{(K)}) = C(X)/\text{Ker}(p) = C^*(\mathcal{O}(X)/\text{Ker}(\pi_0))$$

Thus $X^{(K)}$ is indeed algebraic. Since $\mathcal{O}(X)/\text{Ker}(\pi_0)$ is isomorphic to a $*$ -subalgebra of $M_K(C(T_K))$, it satisfies the standard Amitsur-Levitski polynomial identity:

$$S_{2K}(x_1, \dots, x_{2K}) = 0$$

By density, so does $C^*(\mathcal{O}(X)/\text{Ker}(\pi_0))$. Thus any irreducible representation of the algebra $C^*(\mathcal{O}(X)/\text{Ker}(\pi_0))$ has dimension $\leq K$. Consider now an element as follows:

$$a \in C^*(\mathcal{O}(X)/\text{Ker}(\pi_0))$$

Assuming $a \neq 0$ we can, by the same reasoning as in the previous proof, find a representation as follows, such that $\rho(a) \neq 0$:

$$\rho : C^*(\mathcal{O}(X)/\text{Ker}(\pi_0)) \rightarrow M_K(\mathbb{C})$$

Indeed, a given algebra map $\varepsilon : C(X) \rightarrow \mathbb{C}$ induces an algebra map as follows:

$$C(T_K) \rightarrow \mathbb{C} \quad , \quad x_{ij}(a) \rightarrow \delta_{ij}\varepsilon(a)$$

But this map enables us to extend representations, as before. By construction the universal model space yields an algebra map as follows:

$$M_K(C(T_K)) \rightarrow M_K(\mathbb{C})$$

The composition with $\tilde{\pi}_0 p = \pi$ is then ρp , so $\tilde{\pi}_0(a) \neq 0$, and $\tilde{\pi}_0$ is injective. \square

Summarizing, we have proved the following result:

THEOREM 8.27. *Let $X \subset S_{\mathbb{C},+}^{N-1}$ be algebraic, satisfying $X_{class} \neq \emptyset$. Then we have an increasing sequence of algebraic submanifolds*

$$X_{class} = X^{(1)} \subset X^{(2)} \subset X^{(3)} \subset \dots \subset X$$

where $X^{(K)}$ is given by the fact that

$$C(X^{(K)}) \subset M_K(C(T_K))$$

is obtained by factorizing the universal matrix model.

PROOF. This follows indeed from the above results. See [10]. \square

There are many other things that can be said about the above matrix truncations $X^{(K)}$, and we refer here to [10] and related papers. However, the main problem remains that of suitably fine-tuning this theory, as to make it compatible with the theory of matrix models for the Woronowicz algebras, which itself is something quite advanced, and rather satisfactory. To be more precise here, the situation is as follows:

(1) As a first observation, when taking as input a quantum group, $X = G$, the above truncation procedure does not produce a quantum group at $K \geq 2$, because the

comultiplication Δ does not factorize. Thus, Theorem 8.27 as stated remains something a bit orthogonal to what is known about the matrix models for quantum groups.

(2) Conversely, as already said before, the main results on the matrix models for quantum groups regard the notion of inner faithfulness from Theorem 8.18. And such results cannot extend to general manifolds $X \subset S_{\mathbb{C},+}^{N-1}$, unless we are dealing with special classes of homogeneous spaces, in the spirit of those discussed in chapters 5-6.

Summarizing, many things to be done. The main problem is probably that of talking about inner faithful models for affine homogeneous spaces, but the general theory here is unknown, at least so far. Finally, let us mention that, in the quantum group setting, the known theory of matrix models was heavily inspired by the work of Jones [62], [63], [64], in connection with general problems in statistical mechanics, and in what regards the extension of this to the case of more general homogeneous spaces, or other algebraic manifolds, the motivations remain a bit too advanced to be fully understood.

8d. Half-liberation

As a nice illustration for the above modeling theory, let us discuss now the half-liberation operation, which is connected to $X^{(2)}$, as a continuation of the material from above. We first restrict the attention to the real case. Let us start with:

DEFINITION 8.28. *The half-classical version of a manifold $X \subset S_{\mathbb{R},+}^{N-1}$ is given by:*

$$C(X^*) = C(X) / \left\langle abc = cba \mid \forall a, b, c \in \{x_i\} \right\rangle$$

We say that X is half-classical when $X = X^$.*

Observe the obvious similarity with the construction of the classical version. In fact, philosophically, this definition is some sort of “next level” definition for the classical version, assuming that you managed, via some sort of yoga, to be as familiar with half-commutation, $abc = cba$, as you are with usual commutation, $ab = ba$.

In order to understand now the structure of X^* , we can use an old matrix model method, which goes back to Bichon and Dubois-Violette, and then to Bichon [23]. This is based on the following observation, that we already met in the above:

PROPOSITION 8.29. *For any $z \in \mathbb{C}^N$, the matrices*

$$X_i = \begin{pmatrix} 0 & z_i \\ \bar{z}_i & 0 \end{pmatrix}$$

are self-adjoint, and half-commute.

PROOF. The matrices X_i are indeed self-adjoint, and their products are given by:

$$X_i X_j = \begin{pmatrix} 0 & z_i \\ \bar{z}_i & 0 \end{pmatrix} \begin{pmatrix} 0 & z_j \\ \bar{z}_j & 0 \end{pmatrix} = \begin{pmatrix} z_i \bar{z}_j & 0 \\ 0 & \bar{z}_i z_j \end{pmatrix}$$

Also, we have as well the following formula:

$$X_i X_j X_k = \begin{pmatrix} z_i \bar{z}_j & 0 \\ 0 & \bar{z}_i z_j \end{pmatrix} \begin{pmatrix} 0 & z_k \\ \bar{z}_k & 0 \end{pmatrix} = \begin{pmatrix} 0 & z_i \bar{z}_j z_k \\ \bar{z}_i z_j \bar{z}_k & 0 \end{pmatrix}$$

Now since this latter quantity is symmetric in i, k , we obtain from this that we have the half-commutation formula $X_i X_j X_k = X_k X_j X_i$, as desired. \square

The idea now will be that of using the matrices in Proposition 8.29 in order to model the coordinates of arbitrary half-classical manifolds. In order to connect the algebra of the classical coordinates z_i to that of the noncommutative coordinates X_i , we will need:

DEFINITION 8.30. *Given a noncommutative polynomial $f \in \mathbb{R} \langle x_1, \dots, x_N \rangle$ in N variables, we define a usual polynomial in $2N$ variables*

$$f^\circ \in \mathbb{R}[z_1, \dots, z_N, \bar{z}_1, \dots, \bar{z}_N]$$

according to the formula

$$f = x_{i_1} x_{i_2} x_{i_3} x_{i_4} \dots \implies f^\circ = z_{i_1} \bar{z}_{i_2} z_{i_3} \bar{z}_{i_4} \dots$$

in the monomial case, and then by extending this correspondence, by linearity.

As a basic example here, the polynomial defining the free real sphere $S_{\mathbb{R},+}^{N-1}$ produces in this way the polynomial defining the complex sphere $S_{\mathbb{C}}^{N-1}$:

$$f = x_1^2 + \dots + x_N^2 \implies f^\circ = |z_1|^2 + \dots + |z_N|^2$$

Also, given a polynomial $f \in \mathbb{R} \langle x_1, \dots, x_N \rangle$, we can decompose it into its even and odd parts, $f = g + h$, by putting into g/h the monomials of even/odd length. Observe that with $z = (z_1, \dots, z_N)$, these odd and even parts are given by:

$$g(z) = \frac{f(z) + f(-z)}{2}, \quad h(z) = \frac{f(z) - f(-z)}{2}$$

With these conventions, we have the following result:

PROPOSITION 8.31. *Given a manifold X , coming from a family of noncommutative polynomials $\{f_\alpha\} \subset \mathbb{R} \langle x_1, \dots, x_N \rangle$, we have a morphism algebras*

$$\pi : C(X) \rightarrow M_2(\mathbb{C}) \quad , \quad \pi(x_i) = \begin{pmatrix} 0 & z_i \\ \bar{z}_i & 0 \end{pmatrix}$$

precisely when $z = (z_1, \dots, z_N) \in \mathbb{C}^N$ belongs to the real algebraic manifold

$$Y = \left\{ z \in \mathbb{C}^N \mid g_\alpha^\circ(z_1, \dots, z_N) = h_\alpha^\circ(z_1, \dots, z_N) = 0, \forall \alpha \right\}$$

where $f_\alpha = g_\alpha + h_\alpha$ is the even/odd decomposition of f_α .

PROOF. Let X_i be the matrices in the statement. In order for $x_i \rightarrow X_i$ to define a morphism of algebras, these matrices must satisfy the equations defining X . Thus, the space Y in the statement consists of the points $z = (z_1, \dots, z_N) \in \mathbb{C}^N$ satisfying:

$$f_\alpha(X_1, \dots, X_N) = 0 \quad , \quad \forall \alpha$$

Now observe that the matrices X_i in the statement multiply as follows:

$$X_{i_1} X_{j_1} \dots X_{i_k} X_{j_k} = \begin{pmatrix} z_{i_1} \bar{z}_{j_1} \dots z_{i_k} \bar{z}_{j_k} & 0 \\ 0 & \bar{z}_{i_1} z_{j_1} \dots \bar{z}_{i_k} z_{j_k} \end{pmatrix}$$

$$X_{i_1} X_{j_1} \dots X_{i_k} X_{j_k} X_{i_{k+1}} = \begin{pmatrix} 0 & z_{i_1} \bar{z}_{j_1} \dots z_{i_k} \bar{z}_{j_k} z_{i_{k+1}} \\ \bar{z}_{i_1} z_{j_1} \dots \bar{z}_{i_k} z_{j_k} \bar{z}_{i_{k+1}} & 0 \end{pmatrix}$$

We therefore obtain, in terms of the even/odd decomposition $f_\alpha = g_\alpha + h_\alpha$:

$$f_\alpha(X_1, \dots, X_N) = \begin{pmatrix} g_\alpha^\circ(z_1, \dots, z_N) & h_\alpha^\circ(z_1, \dots, z_N) \\ \overline{h_\alpha^\circ(z_1, \dots, z_N)} & \overline{g_\alpha^\circ(z_1, \dots, z_N)} \end{pmatrix}$$

Thus, we obtain the equations for Y from the statement. \square

As a first consequence, of theoretical interest, a necessary condition for X to exist is that the manifold $Y \subset \mathbb{C}^N$ constructed above must be compact, and we will be back to this later. In order to discuss now modelling questions, we will need as well:

DEFINITION 8.32. *Assuming that we are given a manifold Z , appearing via*

$$C(Z) = C^* \left(z_1, \dots, z_N \mid f_\alpha(z_1, \dots, z_N) = 0 \right)$$

we define the projective version of Z to be the quotient space $Z \rightarrow PZ$ corresponding to the subalgebra $C(PZ) \subset C(Z)$ generated by the variables $x_{ij} = z_i z_j^$.*

The relation with the half-classical manifolds comes from the fact that the projective version of a half-classical manifold is classical. Indeed, from $abc = cba$ we obtain:

$$\begin{aligned} ab \cdot cd &= (abc)d \\ &= (cba)d \\ &= c(bad) \\ &= c(dab) \\ &= cd \cdot ab \end{aligned}$$

Finally, let us call as before “matrix model” any morphism of unital C^* -algebras $f : A \rightarrow B$, with target algebra $B = M_K(C(Y))$, with $K \in \mathbb{N}$, and Y being a compact space. With these conventions, following Bichon [23], we have the following result:

THEOREM 8.33. *Given a half-classical manifold X which is symmetric, in the sense that all its defining polynomials f_α are even, its universal 2×2 antidiagonal model,*

$$\pi : C(X) \rightarrow M_2(C(Y))$$

where Y is the manifold constructed in Proposition 8.31, is faithful. In addition, the construction $X \rightarrow Y$ is such that X exists precisely when Y is compact.

PROOF. We can proceed as in [23]. Indeed, the universal model π in the statement induces, at the level of projective versions, a certain representation:

$$C(PX) \rightarrow M_2(C(PY))$$

By using the multiplication formulae from the proof of Proposition 8.31, the image of this representation consists of diagonal matrices, and the upper left components of these matrices are the standard coordinates of PY . Thus, we have an isomorphism:

$$PX \simeq PY$$

We can conclude then by using a grading trick. See [23]. □

As a first observation, this result shows that when X is symmetric, we have $X^* \subset X^{(2)}$. Going beyond this observation is an interesting problem.

In what follows, we will rather need a more detailed version of the above result. For this purpose, we can use the following definition:

DEFINITION 8.34. *Associated to any compact manifold $Y \subset \mathbb{C}^N$ is the real compact half-classical manifold $[Y]$, having as coordinates the following variables,*

$$X_i = \begin{pmatrix} 0 & z_i \\ \bar{z}_i & 0 \end{pmatrix}$$

where z_1, \dots, z_N are the standard coordinates on Y . In other words, $[Y]$ is given by the fact that $C([Y]) \subset M_2(C(Y))$ is the algebra generated by these matrices.

Here the fact that the manifold $[Y]$ is indeed half-classical follows from the results above. As for the fact that $[Y]$ is indeed algebraic, this follows from Theorem 8.33. Now with this notion in hand, we can reformulate Theorem 8.33, as follows:

THEOREM 8.35. *The symmetric half-classical manifolds X appear as follows:*

- (1) *We have $X = [Y]$, for a certain conjugation-invariant subspace $Y \subset \mathbb{C}^N$.*
- (2) *$PX = P[Y]$, and X is maximal with this property.*
- (3) *In addition, we have an embedding $C([X]) \subset C(X) \rtimes \mathbb{Z}_2$.*

PROOF. This follows from Theorem 8.33, with the embedding in (3) being constructed as in [23], by $x_i = z_i \otimes \tau$, where τ is the standard generator of \mathbb{Z}_2 . See [23]. □

And this is all, on this subject. In the unitary case things are a bit more complicated, and in connection with this, there are also some higher analogues of the above developed, using $K \times K$ matrix models. We refer to [10], [23] for more on these topics.
